>
>FIRST: Don't forget, if I pay taxes, then they're my employees. I can't
>think of any other situation where the employees get to hide their work
>activities from their boss(es).

Most Americans --including the majority of the criminals-- pay
taxes in one form or another, be it federal income taxes, or taxes on
their bottles of Mad Dog 20/20. While police are civil servants &
collectively we influence their operations by voting on laws, etc, you or
I are not their leaders. We don't have a legal right to demand to know
exactly what they're doing at all times, because if you & I do, so do
others who will use that knowledge to circumvent them, & thus damage our
society. I can easily give you an example of 'employees hiding their work
from a boss' -- a menial employee in the payroll department who has access

to salary and wage information is often restricted from sharing that information with people that don't have a need to know, including higher-ups in the company. Your analogy is also used by some of the public who are curious about secret activity conducted by the military (e.g. Groom Lake & the so-called Aurora.). They cite examples of fraud & waste, but the examples that they cite were detected either internally by the agency involved, or by other agencies chartered with the oversight/investigation mission (GAO, IGs, FBI, etc.). These citizen groups actively publicize alleged & proven instances of fraud & misconduct, but I've never seen them cite any examples of fraud or misconduct that THEY detected on their own.

Further, I disagree with your use of 'hiding' in that analogy of yours, but I won't get into semantics. In my experiences, if a law enforcement agency has something to 'hide' or otherwise very sensitive info to convey, they won't pass it over a non-secure radio system. You might think that if the LEAs you monitor don't have secure radio systems, you & other scanner hobbyists therefore have carte-blanche access to their ops via your scanner, thus able to perform some sort of self-appointed watchdog role. While perhaps the intention is noble, it isn't very realistic. Someone else tried to use the infamous "Gorillas in the mist" LAPD MDT traffic as an example of police misconduct. Yes, it was police misconduct, but it was the police themselves that discovered, *publicized* and acted against it. It sure wasn't some scanner hobbyist performing some civic duty. There are full-time checks & balances pertaining to law enforcement activities which are often (certainly not always) effective. A scanner enthusiast who hears something they think to be improper & reports it to the proper people is a nice augmentation at times. But a scanner enthusiast who utilizes their knowledge & equipment in an effort to escape detection & prosecution is an activity that is much more likely to occur.

>SECOND: I don't trust my government. PERIOD! I want to be able to listen
>in on occasion.

Have you run for a public office? I think you can & do listen in right now, don't you? What if someone doesn't trust you. "PERIOD." Do they have a right to "listen in?" Of course it depends on the circumstances, particularly the communications media you were using. But regardless of whether it was a VHF radio or telephone, if you used it to discuss sensitive matters, you would want the right to protect the information by utilizing communications security techniques and equipment.

>THIRD: As I mentioned in another posting, I use my scanner to find out
>where accidents and such are so that I can STAY AWAY, and know to use any
>alternate routes I have available.

I really don't want to believe that you feel this is a valid reason for LEAs not to be able to encrypt communications! I have a scanner installed in my car, and drive about 30,000 miles a year. I don't know where you live, but long ago, I discovered that it is much easier to get info on major traffic accidents impeding traffic via broadcast radio, for

example WWJ & WJR in the S.E. Michigan area.

To briefly reiterate my philosphy, I enjoy playing around with scanners, as demonstrated by the several thousand-dollars worth that I own. We seem to agree that Illinois' original anti-scanner legislation was poor. But if law enforcement agencies need to rely on radio communications for law enforcement operations (I hope we agree that law enforcement operations are necessary...), sensitive operations (such as surveillances/investigations, & dispatches to many 'in-progress' type crimes, but not necessarily to traffic accidents, or when giving suspect descriptions) need to be protected by communications security systems. In my opinion, the benefits of doing so will greatly outweigh the negative. The LEAs must have a clear, written & enforced policy concerning information to be transmitted via non-secure systems (not just RF, but particularly cellular phones) & secure systems. Unfortunately, most don't.

> > >John >

>Scariest words in the USA: "Hi! I'm from the government and I'm here to
>help."

A lot of people like to say that. Until a major disaster happens.

The perceived hinderances are much more noticeable (& fun to complain about) than the many benefits which (some) people take for granted.

Thank "the government" for Internet, John.

Hi Ron,
just looked them both up for you in the Radio Comm. Handbook
(by the RSGB here in England)
{The copy I have is a bit old now, but the data will be the same}

rg58 50 ohms, db loss @ Mhz (per 100ft):-
.42@1 , 1.4@10 , 4.9@100 , 24.0@1Gig , 45.0@3Gig
rg59 b/u 75ohms, db loss @ Mhz (per 100ft):-
??@1 , 1.1@10 , 3.4@100 , 12.0@1Gig , ????@3Gig

In other words, yes, it appears to be better.
The ??? ones are't quoted.
73's bfn Terry..

If this is the case, then just about any Bearcat home scanner would be
in violation of the law, because they operate on a 12VDC adapter.
Eventough they plug into an AC outlet, it is operating on 12VDC.

Tim, just wondering where your data came from. I assume you have data to backup the statement to the effect that scanners are more likely to be used for criminal activities then for the more noble acts. Sounds like Media Hype. The same Media Hype the big Anti-Handgunner journalist used who said guns should be outlawed. He, by the killed a kid breaking into his house and he of course used an unregistered handgun.

Listening to several of the trunked radio systems in the Detroit area that have a phone patch I know why they want secure radios. They don't want the taxpayers to hear them call their girlfriends, wives etc and shoot the bull and or talk about the people who they just completed a call to.

There is a very fine line between freedom and order. Such a fine line I don't think the proper balance will ever be reached. We as a society seem to be approaching Russia's former society and they ours. I don't think we are going to be the lucky of the two. I hope I'm wrong. I'm not ready to give up freedoms to reach a more law and order society. I think the proper way is to enforce the gazillions of laws that are already on the books.

RE Rg59 vs RG58
RG59 is commont TV cable coax, while the impedance is off (75ohm vs 50 ohm for RG58) you can put it to use if you have no intentions of transmitting. I use the RG6 TV coax at my setup,
The loss for RG58 at 900 mhz are too high to even consider it for runs over 6 feet.

> frequency coverage. Any comments would be appreciated.

You might also consider getting a base unit. Remember that
when designing portable units, performance are sacrificed in terms
of portability. I think the BC200 has the necessary coverage for
portable use whilst a good base scanner with general coverage is
an excellent second choice. Also remember that a good base scanner
allows you to connect an outdoor antenna without overloading the
radio. Portable radios usually suffers from intermodulation and overload
when connected to outdoor antennas. In urban areas they might even
become totally useless.

I don't know if you already operates your BC200 from an external antenna
when home but if not, getting a base scanner and a good outdoor antenna
(I can recommend a discone antenna) will open a whole new world of
scanning.

If you are attracted by the HF coverage offered by the IC-1 and some
other portable units forget it. If you wants HF you are probably
much better off getting a second hand HF communications receiver.

In my opinion the ideal combination is a base unit for home and a portable
for car/walk.

Based on own experience and on information from other users I would
recommend the PRO-2006 as a base unit and the PRO-43 as portable.

>the easy mod put there to attract sales from people who like to delve in
>quazi-illegal stuff? Are these frequencies used for something else in
>other countries where the scanner is sold?
>--

Well most countries have cellular phones in the 800-900-1000 MHz range, but
the exact frequencies vary from system to system.

The real reason for allowing the modification is because the scanners
are usually sold world wide and some countries have no limitations
on what you may monitor.

I live in Denmark, where scanners are absolutely illegal cellular
capabilities or not. But in Sweden (only 45 minutes by boat from here),
there are no restrictions and all scanners are sold without limitations,
so you don't have to do any modifications to get full coverage.

I will be interesting to see what the manufacturers will do in the future.
My guess is that they will make two models, one for the US and one for the
rest of the world, with the only difference being the chip containing
the driving software.

Remember that even today the are different models around due to
different mains voltage levels in different countries.

....The last time a local government tried this was with HAM radio antennas. The outcome was they could not declare an absolute ban on the antennas. They could only limit the installation based upon safety regulations, not appearance. The result was that if the outcome of any confrontation caused the amature operator to be deprived of operating then the Federal law takes precedence. I see the state of illinois running smack dab into federal court just like Tennessee did and they will LOSE big time. They also have to contend with the ECPA which allows monitoring of any and all (non-encrypted) public service, GMRS frequencies and Federal Government frequencies. They may possibly get you on the use of it in a vehicle as a distraction during driving but then they'd have to contend with the use of cellular phones also......but that would be a vehicular and not a criminal offense.....we'll just have to wait and see.....by the way Tennessee tried to ban ham radios from vehicles because they could pick up the public service band.....

>>
>>THIS IS OUTLANDISH! Write to the members of the Illinois
>>Leigslature, and the Governor. Especially this fellow Cross. This
>>is clearly in violation of the FCC directive on laws restricting
>>the possession of amateur radio equipment. Your PRO-2006 and most
>>other Base radios can be powered by 12VDC, and thus would be made
>>illegal under this propsal. Pass this message onto other BBS
>>systems. Notify every amateur radio operator you know, and the
>>ARRL. Get ready to write a lot of letters. I will post a complete
>>address list for the Illinois House of Reps in the next few days.
>>
>>Note that the press are exempt. Act now or dont complain when
>>they arrest you for listening to the radio. This is not a joke.
>>This is real. Its time once again to defend our rights, what are
>>you going to do? - Ted / Chicago Area Radio Monitoring Association.

the mvt7000 and the mvt8000 do not receive SSB. The mvt7100 does.

The R1 is a nice radio, but falls a bit short of the mark withoug
having extensive filter mods done. I had one once that I sent
to Raycom in England for the filter mods. With that done it
worked pretty well.,

I am going to Las Vages next weekend and would like to have the police, fire and ambulance frequencies.

Also, does anyone have the frequencies for any of the hotels (The Luxor!)?

Any other interesting Vages frequencies would be cool too.

Thank you,
Arik Klingensmith arik.klingensmith@ebay.sun.com

by the time they come for your hunting rifles, there won't be any neighbors to stand "elbow to elbow" with. you'll learn the same lesson pastor Niemoller did, but yours will be even more painful. he simply didn't speak up for the demonized members of his society.

Possibly the most preposterous analogy I've heard or read in at least 20 minutes. Not to mention offensive to millions of REAL victims with something legitimate to cry about (if they are still able, which is unlikely).

Rich white boy gun collector <> holocaust victim. Sorry. There are some good arguments against gun control. How come you guys never use them?

I'd like to make a general comment, not directly related to this issue. Have you ever noticed how obnoxious people can be when they're driving away from you in there cars? People who would never dream of pushing in line in front of you at the supermarket don't hesitate to force you off the road to save 5 seconds. I don't think they'd do it to your face, y'know? I think this electonic communication sh*t is similar. Somehow this electronic intermediary causes to be far more obnoxious and offensive than they'd probably be to your face. I don't mean that to sound like some sort of a challenge. It's just an observation. Do you talk that way to your friends? Your coworkers?

3082. Crypto: For Cops AND Criminals?

Newsgroup: rec.radio.scanner
Date: 1994-04-25 18:16:00 UTC
From: kevin jessup <kevin.jessup@mixcom.mixcom.com>
Message-ID: <1994Apr25.181600.6569@mixcom.mixcom.com>
Source record: 275095

I enjoyed Tim Tyler's post on cryptography as used by police to
"make private" their conversations. I agree 100%. They should
be using the best RF digital cryptography system available.
(UN?)fortunately, they have to work within a budget like the rest
of us. (Well, not the feds. :-))

Everyone else deserves security too! How long before digital UHF handhelds
with a user-defined crypto key are made available to the average
business band user? Will the government outlaw such technology
if it does not have the "Bill Clinton/AL Gore certified" clipper
technology? (In other words: easily monitored by the feds).

Since technology has advanced to that point, don't ALL USERS
of RF, have a right to secured data (and voice) transmissions??
I certainly hope so.

And as an afterthought, let's assume the government DOES NOT
force the "Clipper fiasco" on everyone and that the free market
makes truly secure digital communication to all. Criminals
will have access to the technology as well. What does the
net think of that?? How much do you value your RIGHT to
secure communication?? (I know this has been discussed on
other areas of internet, just thought I'd liven it up here
for a bit! ;-))

And yet another thought...
Amateur radio prohibits secure data transmissions. You cannot encode
a message if the intent is to hide the meaning of the message. Imagine
if truly secure VHF and higher communications is made available to
the public. Imagine digital direct sequence spread spectrum handhelds
that can be programmed with a unique encryption key AND speading code.
Does this eliminate the need for obtaining an amateur radio licence
if you only want casual and secure local communication? I am
assuming hear that the individual does not want to bother with an
amateur radio test and does not want to pay for GMRS or trunked
system access. All he wants, in effect, is "secure CB". Any
comments?

Source record: 275053

Does anyone have any reports on the performance of the new BC 120XLT and 220 XLT (replacements for the 100XLT and 200XLT)? In particular:
Does the Turbo scan feature shorten battery life?
Is the 180 mW audio output spec accurate, or just a lowball SWAG?
Is the RF performance any better than that of the 100/200 XLT?
Does the data skip function really help?
Has Uniden made any real improvements over the 100/200 XLT with these new units, or are they now capable of receiving more interference faster than ever before?

Eric

Nobody has come for mine yet, either, chum.

I find it absolutely amazing that you believe that "debate"
is going to make a difference.

>See my previous posting re obnoxious drivers.

Yes. The "reasoned" approach. Very convincing.

Obviously *YOU* deserve *your* guns.

I own a Realistic Pro-2001 progrmmable receiver scanner,
if I wanted to sell it, what price do you think I could get for it.
It's in excellent condition & working order. If anyone is
interested please let me know. Also don't forget, I'm looking to
see the opinions on the price I could get for it! Thank you.

: the road....

This comment is NOT directed at JC Austin. I am merely using his
analogy as a jumping off point for mine. We need more analogies, right?

I've also noticed that the change that comes over people when they
get behind the wheel of their car is like the one that comes over some
people when they post or send email through the ether.

That's all. Back to gun control...

Hi all,

Does anyone in Netland have any experience witht the 22" cellular look-alike antennas for scanners that are glass mount as sold by Grove and others? How do they compare to other antennas (ie. mag mount)?

Thanks for your help...

Chris K. McCormack
mccormac@mprgate.mpr.ca

> Second point: somewhere in Louisiana. Killed a Japanese guy.
> Got off.

Even if eliminating guns would prevent some such tragic misunderstandings,
we must balance that against the real attackers who, aside from armed
victims, might otherwise NEVER get shot.

> Also near here in Durham NC. Homeowner found some _kids_
> in his garage. They ran, so he shot one of them in the back
> and killed him. Got off. jca

I heard that they _were_ in fact burgalars.
Teenage burgalars, in fact, who would be _quite_ offended
to be referred to as "boy."

Though the literal reading of the law forbade shooting
under those circumstances, I don't consider the death
of the burgalar to be lamentable. Do you?

3093. Pro43 audio mod - request for opinions

Newsgroup: rec.radio.scanner
Date: 1994-04-25 20:34:33 UTC
From: g_stofko@kau100.cth.dec.com
Message-ID: <2ph9gp$21v@nntpd.lkg.dec.com>
Source record: 275069

The Pro43 audio mod is supposed to reduce the "bassiness"
of the audio output and make it "crisper".

As it is a bit of a finicky operation, I'd like to find out if anyone
has done it and noticed a difference before I go ahead with it.

Thanks for any info.

The argument against restrictions that works best for me is that if someone passes a signal through my body, I damn well have a right to listen to it (stated in less beligerent terms, depending on the audience). Has something similar been used in committee meetings like these? If so, what has been the response?

RE:

>Water selling for $10 per gallon in a drought encourages those with
>water to bring it to those without, a positive event for those in
>need of water. Price controls result in no incentive to bring
>water in, and a continued shortage. When enough water is brought
>in, the price declines. Ditto for plywood.

I guess that`s why people were prosecuted for price gouging after
Hurricane Hugo (water and plywood) and the earthquake in L.A.

How about a better analogy? Remember the pricing of the Mazda Miyada
(sp?) when it was new? I know a few people that paid 1 to 3 K more than
SRP just to get one. More than one dealer was investigated for taking
"list" money (money to get on a list to buy) or playing games with
delivery dates to maximize their profit when these came out.

>If you don't like the price, don't pay it. Please take your complaints
>to alt.socialism.

I didn`t pay that price ($700) I paid a better one ($570). That ($130)
buys alot of extra goodies. I personally enjoy making money by a good
deal equitable to everyone better that making an excessive profit. I
don`t consider that socialism, just honest business. Thats why I never
"clean up" at a swap meet or hamfest.

Socialism is defined in Websters Ninth New Collegiate Dictionary as
advocating collective or government ownership ownership and administration
of the means of producing and distributing goods.

How is this definition relevent to me? I never said that I wanted the
government (or a co-op) involved at all. In fact, its obvious thru
Richards posts, mine and other peoples responses that capitalism (and free speech) is alive
and healthy in netland.

The Real Question:

Is it right to equate the importation of cellular capable receivers with
drug and gun smuggling and then try to sell the same item at a price >$100
more than average street price? And then to justify the price it on the
grounds of unavailablity due to this law?

Richard I apolgize for any personal flames I may have directed at you.
I just didn`t agree with your justification of your pricing. I have
enjoyed your posts in the past and look for more in the future. I`m much

more interested in using the rec.radio.scanner bandwidth for scanner and (Yupi name...) Multiband Receiver related issues.

End of this thread....(for me) Further replies to alt.devnull.
(I just don`t care about this topic anymore...)

Yupiteru stuff:

I received my Yupi two days after sending Radio Lorenz a MO ($570). The service was great. (4 shopping days left...). Now what do I put in 1000+ channels?

I love my Yupi. I used it when I saw The Who's Tommy yesterday (4/24) in Austin. I found 7 wireless mics in three bands (out of 30 according to the mic guy).

EMAIL me for more info on these freqs. (barryc@mpd.tandem.com).

CUL,
-barryc

: My 2 cents.

: Gary

I wonder if there have been some revisions in the R1 since the experiences
of mine with the R1 are MUCH different. I live in a highly populated area
and really enjoy my R1. I find the operational aspects of the radio to be
as good as any other scanner I have. (AOR 3000A, ICOM R100 and Bearcat).

I also have direct access to many other scanners. I am very happy with the
R1, although it wouldn't be my primary scanner as mentioned before in a
previous post.

Just my clouded view of things.

I am currently using the glass mount all-band that Rat Shack sells. It's fine for me (mostly repeater UHF monitoring), but it has trouble with VHF lo. Also, I have been told by those more knowledgeable than I that you lose up to half the signal going through the glass. For general knowlege, they recomended band specific (read:tuned) antennas that are permanent mounts. The question is: do you want to drill a hole in your car? I will be using a VHF/UHF tuned celluar look-alike like those that PSP uses when I return to the PA midstate. I will let you know the results.

I think you missed Steve's point. If the law as written does not exempt hams and their licensed equipment, then it is blatantly unconstitutional and violates the expressed Will of Congress. In fact, if it also affects GMRS and other mobile 2-way radio equipment for which people have FCC licenses, it is still unconstitutional. Such laws are automatically preempted by Federal jurisdiction.

That depends on how the government defines "manufacture".

Also, the manufacturers are not interpreting the law to include
transceivers on their own. Congress has already defined "scanner" to be ANY
radio receiver that automatically samples 4 or more memory channels.

Jeff can you post the name of the security guard agency? Can you describe the antenna length and width? Is it 8" long and 3/8 fat or 6" long and 1/4 thin. Give us the best description you can of the shape so we can tell what band they operate. We might find their name in the FCC database with all of their frequencies.

Radar detectors - mounted in or on vehicles - are regulated provincially, so laws vary from province to province. Here, in B.C. they are perfectly legal.

In any case, radar detection isn't usually considered listening in the usual sense the word is used.

In Canada, laws governing radio transmission and reception are the purvue of the federal government, notwithstanding radar detectors.

So far, the government seems to be willing to let us listen to anything except scrambled video transmissions as long as we don't disclose the content of non-broadcast or non-amateur radio traffic. In other words, it's legal to listen to a scanner receiving two way radio conversations, as long as you don't divulge them to anyone or make use of what you hear.

I think I prefer that to being told it's illegal to listen to various frequencies anyway - especially when they don't have any way of enforcing it.

: Thanks

: Mike

I have an AOR 1000. If you want a FULL coverage radio from shortwave to
1300 mhz, you should look at the 1000. I am not sure you can still get
the one w/ no cell. gaps. Yhe 1000's manual is worthless and it takes
some time to figure out the controls, but the radio is OK. If you just
need to scan the standard bands, do not wish to get TV, then I would
recomend looking at the 43 as it is a better price.

>(UN?)fortunately, they have to work within a budget like the rest
>of us. (Well, not the feds. :-))

As usual I disagree 100% with what Tim Tyler had to say regarding
the use of encryption technology. I can understand why a tekkie
junkie like Tim would say that, with his reputation for speaking
before thinking, but on longer reflection anyone with half a
bit of sense would realize this is a very dangerous thing to allow
in the hands of the police.

Tim's comments were entertaining, but entertainment is just that.
What is important here is checks and balances. If the police can
conduct their everyday affairs under the veil of secrecy, how long
do you think it will take before one of them realizes that he can
say whatever he (or she) pleases with zero chance of a mere citizen
being able to hold them accountable? Given that this WILL happen,
what sort of abusive actions might they be able to get away with
that they otherwise would be reluctant to engage in for fear of
being caught?

We have all probably heard of the "Gorillas in the Mist" comment
from the Rodney King episode. This is only a rather mild example
of the sort of abuse the police subject their citizenry to.

There are natural checks and balances we have in place, and it
is important to keep them there. Those that mess with them run the
risk of creating the groundwork for a gradual enslavement of the
entire country. Stalin loved secret police activity. I don't
think TIm is really wanting to see our society go that way. But
his proposal would certainly move us another step closer if adopted.

in case you've been checked out of reality for the last year, it
wasn't too long ago that nearly a hundred men, women & children were
burned to death as the result of a government attack. the reason for
the attack? they had (gasp) guns!

> Rich white boy gun collector <> holocaust victim. Sorry.

death is a great equalizer, innit? (i'll let the less pigmentally
challenged gun owners in this forum reply to the racial slam...)

> Have you ever noticed how obnoxious people can be when they're
> driving away from you in there cars? [...] I think this electonic
> communication sh*t is similar.

have you ever noticed how people confronted with facts via this
electronic communication shit (you can say "shit", cancha?) delete
90% of the article they're following up to and comment on an analogy
that makes them feel uncomfortable instead of replying with relevant
facts?

> Do you talk that way to your friends? Your coworkers?

hypocrites don't become my friends, and my coworkers are buying
guns because they realize that idiots are selling their freedom for
them.

so, back to the subject at hand: how do you feel now that your
hunting rifle is an "assault weapon preferred by gang members"?
ready to stand "elbow-to-elbow" yet?

i'm not holding my breath.

It seems that I need to make a general announcement about trying
to email me. First, the mail server that links PA and helps get mail in
from the rest of the country is having problems: mail is late (just like
USPS!) or gets bounced back, which seems to be the case most often. Also,
the reply-to: line in my mail is incorrect, which will inhibit those whose
systems automatically put in the email address. The correct, and only one
to use for now is the one in my sig.
To George, Ravi, and Carter, the information is on the way --
there more than likely will be problems in getting it. Please let me know
what happens.
I will post the PSP freq's and barracks again this week for those
who missed them.
Thanks for your patience.

Tonight we had a terrible storm with large hail and multiple tornados.
The towns of Desoto and Lancaster were heavily damaged.

I tuned in the ham frequencies (144-148, 440-448) and found a repeater
the hams were concentrating on their reports of conditions. I was
impressed.

As the 10pm news reported on hail damage reports, the hams were
screaming rapid fire reports of exact location of a twister on the
ground (locating it by watching power lines short out in the darkness).
One ham was tracking the storm while driving through 1" hailstones,
but continued on dispite intense damage to his vehicle. You
could hardly hear him through the hail pounding the car.

As the TV news talked of window damage, the hams were reporting
vehicles flipped upside down wrapped up in power lines.

The repeater channel was moderated by one ham and well organized.
They soon had to split the action to a storm tracing channel
and a first aid channel.

The action went on far into the night. All power and telephone lines
were taken out and police and ambulances totally depended on the hams.

My opinion of hams has changed. I used to think it was somewhat a
useless hobby, where all people talked about was radio equipment.

My hats off to all you hams out there.

3122. Re: SMR Vs. Cellular

SMRs (Specialized Mobile Radio) are systems in the 851-866 and 935-940 MHz range that offer mobile radio services to their subscribers. Small users get the benefits of a large (trunked) system without having to provide the towers, repeaters, etc, themselves. It is a mobile-mobile and mobile-base system, not a telephone service, although the provider may include phone patch, message storage, signaling, etc.

A decent trunking transceiver will cost several times the price of a cellular phone, and the provider's fees will probably run well over the base charge for cellular service.

I haven't seen the infomercials, but it sounds like the same con that was done for the cellular auction and other FCC frequency introductions. For a large fee the promoter will prepare an application with all the technical requirements. The FCC will review the application package, identify a dozen flaws and reject it. Should by some chance the application be approved, the sucker would find himself expected to spend 100's of thousands of dollars to build the system, then find subscribers to use it. Several promoters have found themselves explaining their work to Federal Court judges.

Scanner listeners will not be able to monitor a single subgroup (we call them talkgroups) if the call drops and is reassigned on a different channel. If you happen to catch a call where the people continuously keyup within the programmed hang time of the system, you can catch quite a bit of the conversation. If the system is busy, then forget it -- the call will go to the first available channel based on whoever in some other talkgroup dekeys and nobody else in that talkgroup keys up.

Yes, the subgroups are constantly updated on the control channel, but in order to monitor the calls, you will need a trunked radio scanning that control channel to determine which freq. to go to for the actual call. You could spend years trying to decode the control channel, so it's probably not really worth the effort.

It gets even worse. When the world goes digital (State of Florida has a Motorola ASTRO Digital Trunked System on the air right now) it will be even more difficult to monitor both trunked and conventional systems. If you know the freqs, you'll just hear static.

If the first guy had to tell the second guy to go to five, they just
changed from one talkgroup to another. Probably to a talkgroup that fewer
people had programmed into their radios or one that is less frequently
used. If they really wanted to go into "Private" mode, all one would have
to do (assuming they purchased the option and have it programmed into their
radios) is hit a Private Call button, type in the other radio's ID, and a
private call is setup.

HAMFEST CALENDAR 1994 - NORTHERN ILLINOIS
last updated April 26, 1994

o Please report additions or changes to Bob Parnass, AJ9S, office phone: (708)979-5414, electronic mail: parnass@ihlpf.att.com.

APRIL

April 29, 30, and May 1: Dayton, OH - Dayton HamVention. Hara Arena, Information, General: (513) 276-6930, Flea Market: (513) 276-6932 (Reservations not accepted by phone). Write: Hamvention, Box 964, Dayton, OH 45401-0964.

Advance Registration: Checks in $US, payable to Dayton Hamvention. Send name, address, call, and day and evening phone numbers. Enclose separate checks for admission and Flea Market.

Be sure to indicate either: Send admission tickets ONLY if flea market space assigned. Send admission tickets REGARDLESS of space assignment. Admission: $11.00 per person ($14.00 at door, good all 3 days). Banquet: $22.00 per person ($24.00 at door, if available). Send to: Dayton Hamvention, Box 1446, Dayton, OH 45401-1446.

MAY

May 1, Sunday: Sandwich, IL - DeKalb Hamfest, Kishwaukee ARC. Admission $5. Sandwich Fairgrounds, Suydam and Getty Roads, Sandwich, IL. For info, contact KARC, PO Box 264, Sycamore, IL 60178.

May 22, Sunday: Wheaton, IL - GMRS of Illinois May Fest '94. Admission $5. Starts 8 AM. Setup 6 AM. Info, call (708)690-1492.

May 29, Sunday: Chicago - Chicago ARC. DeVry Institute, 3300 N. Campbell. Starts 8 AM. Setup 6 AM. Admission $4. Kids under 12 free. Talk-in 147.255, 444.825. Info, (312)666-1606 or (312)545-3622.

JUNE

June 5, Sunday: Princeton, IL - Starved Rock Radio Club. Bureau County Fairgrounds. Admission $5. Talk-in 146.355/955. Info, Bruce Burton, KU9A (815)795-2201.

June 12, Sunday: Willow Springs, IL 6 Meter Club Ham-fest, Six Meter Club of Chicago. Santa Fe Speedway, 91st Street and Wolf Road. Admission $5. Gates open 6AM. Talk-in on 146.52 simplex or 146.97 repeater. Info, call Joe Gutwein, WA9RIJ, at (708)963-4922.

JULY

July 24, Sunday: Stickney, IL - DuPage ARC hamfest, Hawthorne Race Course, 3500 South Cicero Ave. Handicap accessible. Starts at 6 AM. Talk in on 142.25 MHz with 107.2 PL. (-600). VE Testing 9 - 12. Advance tickets are $4.00, $5.00 at the door.

This hamfest used to be held at the American Legion in Downers Grove and was a good small to medium-sized ham-fest. This year, there will be a 30,000 square foot indoor exhibit area in an air conditioned building, plus outdoor tailgating.

For advance tickets, send check payable to DARC, enclose SASE, and send to Hamfest 94, 7511 Walnut Ave, Woodridge, IL 60517. For commercial or fleamarket tables info, call 708-985-9256.

SEPTEMBER

September 11, Sunday: Joliet, IL - Bolingbrook ARS Ham/Computerfest, Inwood Recreation Center, 3000 W. Jefferson. This is a medium size hamfest with indoor/outdoor flea market. Gates open 8 AM for general public. Outdoor flea market on paved lot -- setup at 6 AM. Use Exit 253 from I55, or Exits 126/130 from I80. Admission $5. VE testing 9 AM - 12 noon. Bring original license and photocopy, ID and photo ID, plus $5.75 test fee. Novice-only tests are free. Talk-in 147.33, 224.54, and 443.525 MHz repeaters. Indoor table reservation, call Ed Weinstein at 708-085-0527. Info, BARS Hotline (708)759-7005 between 6 AM and 9 PM.

September 17-18, Saturday & Sunday: Peoria, IL - Super-fest. Admission $5. For more info call (309)685-6698. Talk in on 146.76 (-600 kHz offset).

September 24-25, Saturday & Sunday: Grayslake, IL - Chicago FM Club, Ham Radio Expo. This is a large ham-fest with indoor and outdoor flea markets. Lake County Fairgrounds, Rts 45 & 120. 6AM - 6PM. Info 146.76 MHz (-600). Admission $6 at gate, one ticket good for 2

days. Kids under 12 free.

NOVEMBER 1994

Nov 27, Sunday: Wheaton, IL - GMRS of Illinois May Fest
'94. Admission $5. Starts 8 AM. Setup 6 AM. Info,
call (708)690-1492.

...interesting.....I would venture to say that a "scanner kit" does
not fall in the purvue of the FCC since it is not considered a fully
functional product for retail purposes.......hhmmmmm.....what about a
computer card that not only is a frequency counter but also a
tuneable receiver (aka a "scanner")....the software determines how it
operates, scanner, searcher, freq counter, spectrum analyzer,
etc......

Part of me agrees with this but another part of me doesn't. I think it is a
little self serving to think that us scannists play any real role in
regulating police activities. To think that we, somehow, prevent police from
performing illegal acts by monitoring their comms is a bit silly. Perfoming
illegal acts does not necessarly require any radio communications.

Ben, Post to rec.radio.scanner. There is an ongoing thread about LoJack
over there.

The most common freq seems to be 173.075 MHz. Look for the 4 antenna
Doppler array on your neighborhood cruiser. Inside you'll find a
dash-mounted panel with a multi-digit display and a ring of LEDs. Once
the system is activated (by LoJack triggering the beacon), the VIN shows
up on the dash and the LEDs point the way.

MA, NJ, FL, DC, and others have the system. Again follow the thread over
on r.r.s for more details.

Yah, that's the Channel-Master scanner antenna. I have one hooked up to an old Bearcat, works pretty good. Claimed freq range is 30 to about 900 MHz. I think it's just a variation on the "fan dipole" antenna that hams use. The supplied balun has an "F" connector for 75 ohm coax, so use RG6, or RG59 if your cable is short (less than 25 feet or so).

>

Let's think about this for a minute. I would dare say that EVERY scanner not only CAN be DC power operated but MUST be DC power operated! Even a base-type scanner that plugs into an AC outlet simply converts that AC to DC inside the unit; the solid state electronics inside your scanner require a DC voltage. So depending on the technical knowledge of those enforcing the law, it will either prevent possession of ALL scanners or it will simply require a simple mod that puts a DC power jack into the scanner after the transformer/filter circuit. Or maybe we're forced to go back to vacuum tubes!

I tried the audio mod on my Pro-43 and didn't like it. Removing the capacitor made the audio *MUCH* better but also increased the amount of hiss that came through to unacceptable levels (for me to tolerate that is). Since I didn't have any other smt capacitors to try, I replaced the original. When I use the Pro-43 in the house, I use an amplified speaker with a tone control. In the car I usually use a small set of unamplified stereo speakers for a walkman type radio. The larger speaker produces a bit more volume than the internal speaker and the cheap construction kills most of the bass ;)

Refering to several posts about coax to use for scanners --

I just installed Belden 9913 on both of my discones. 9913 is about the size of RG8, it is stiffer then normal coax and has a 50 ohm impedance.

Its loss at UHF is much much lower than RG59 or 58 (don't have the specs here at work but if there is interest I'll bring them in).

It made a measurable and remarkable difference!

Two drawbacks 1 it is more expensive -- about $0.55 per foot
2. it is harder to work with

Rich

But, as said, it is most definetly NOT illegal to make your own
scanner or converter, etc. Thus, publishing details on how to
do so via the net is in no way illegal, nor should anyone be
upset about it. Certainly, even if it were illegal to "build
your own," the knowledge as to how to do so is not illegal.
To somehow "outlaw" the distribution of such information would
require a major "adjustment" to the first amendment.

For many years, there were designs floating around, as well as
published in various magazines/newsletters, etc. for devices
which, if built, were used to defeat the telephone company
billing process for long distance calls. I have no recollection of
anyone ever being charged, much less found guilty, of any
violation for having and/or distributing the construction details
of those devices.

I believe those switches change the PL (sub-audible) tone. Changing
the frequency on those radios involves a crystal swap and re-tuning, I
think. The high-end motorola hand-helds have synthesized tuning and
can be re-programmed for new frequencies with a PC and some software
from Motorola, but I don't think the Spirit line is synthesized.

What portable handheld scanners are good? Where is the best place to buy one- Radio Shack or somewhere else? Also what is the deal with the 800Mhz frequencies? Can you enter them in and hear both sides of the conversation, or is it more technical than that? The Bearcat scanner I have now is an inexpensive one which does not cover very many bands. I want to get a new scanner, but do not know what kind to get. I am leaning towards a portable, handheld model. Will this work with a magnetic mount anntenna on a car and still receive good without hurting anything. Basically I am looking for any information anyone can give me, since I am a beginner. Also I am looking for Southern Ohio frequencies, such as business ones- like power companies, water companies, and other such utilities. Any help given would be much appreciated. Thank you.

Everyone should be happy this isn't the Fido echo. You're not even allowed to use the word "cellular". They all call it the business band over there as if no one knows what they're really talking about.

Among other things, you're not allowed to discuss the code/no-code issue either. The moderator decided for the world that it's a dead issue.. just as "good" conversations were popping up here about extending the no-code up through the ranks, too. Real stickler. I'm generally just a reader in both places, but I always enjoy coming back here.

| Which is precisely what the attacks on civilian
| owned military-style semi-automatics are all about in the USA.

|I don't agree. I don't buy it.

Come on up to talk.politics.guns if you want to get into this.

| Who are these guys, and why do they want our guns so much?

| FBI?

Yes. The current FBI head has no problem with gun bans, and the FBI head under Bush had no problem with it either. There was also an internal FBI "study" of gun control advocating this, and was in fact featured in some NRA ads in sporting magazines.

Also, Department of Justice under Janet Reno has been advocating these semi-auto bans.

| CIA?

I suggest you look at Nelson T. Shields' book "Guns Don't Die" for the role that CIA current-and-ex employees had in forming Handgun Control Inc. Shields was once the head of HCI.

BATF is also actively supporting the bans on semi-autos.

| Liberal media?

A worthy mouthpiece for HCI in the spirit of Radio Moscow. NPR is an excellent exemplar of news media shills for HCI.

| ACLU?

ACLU was once affiliated witht the National Coalition to Ban Handguns, whose new name, the Coalition to Stop Gun Violence, reflects their expanded activities, of which banning "military-style semi-automatics" is but one.

The national ACLU has withdrawn their affiliation with NCBH, but local chapters are still advocating gun bans.

| Democratic National Committee?

So much so that an opposition organization entitled: "Democrats for the Second Amendment" has been formed.

|Incidently, smarter than a frog does NOT equal intellectual. Frogs aren't
|that smart ('though I guess it depends what you're used to).

Amusingly, I noticed another Chinese dissident was released by the PRC,
and was immediately flown to the USA for medical treatment. Seems being
an "intellectual," a physicist among other things, didn't help him
one iota in the face of his political jailers... or how about that other
Chinese dissident from awhile back who was under US diplomatic protection,
the astrophysicist? All that intellect, certainly much more than a mere
frog, not meaning a damn thing in the face of smallarms wielded by
communist minions... I guess it didn't impress them enough, huh?

Source record: 274941

The American public MUST be allowed to monitor any public service frequency it desires ! I do not believe the police officer on the street or the fire fighter or the ems technician give your monitoring of there radio transmissions a second thought, UNLESS, you get in there way, then you and your scanner should be instructed to get out of the way or you will be taken to jail.

The politicians, mayors, county executives and governors who direct the operations under their control are the ones who need watching. Paranoid, self-promoting politicians are the problem, not the police officers, fire fighters, ems technicians or civilians who monitor there radio transmissions.

Case in point: The former mayor of Detroit forced a trunked radio system on the police department, press reports said the police did not need or want it. So, why was a trunked radio system installed ? If you take a look at what services use the system it becomes clear. The former mayor denied that Detroit had a gang problem while the citizens suffered the results of gang activities. Where are gang squad officers found to operate ? on the trunked radio system. The press said the mayor was using the system to cover up the problem. The former mayor wanted and got a new trash incinerator said to be the worlds largest and that its operation would not hurt the environment. Where can the plants operations be found, your correct on the trunked radio system. The public lighting commission which generates electric power for street lighting, traffic lights, schools etc was having major problems. Large portions of the city would have no street lights for weeks at a time. The press reported these problems and was told by the mayor they were adding to the problem by telling the criminals where the lights were out. Guess were the lighting commission now operates, the trunked radio system.

This is a classic example of how radio transmissions are hidden from the general public, and the press. First hand knowledge of what is happening in your community is dangerous to the politician.

Hokay - well good luck with all but the old INMARSAT-A protocols. Things like
INMARSAT-M are digitized voice, fax, secure voice, and data using a fairly
um er complex set of algorithms and voice coding etc. (4.8kbps basic data rate
for voice et al.) You'd have to figure out the scrambling vectors assigned as
well as learn the proprietary voice coding algorithms and the proprietary
protocols involved.

>Why?
>
>One of my grandmothers was a full blood Danish Jew.
>
>By Aryan standards, I'm "tainted." Severely and sufficiently.

I'm probably more tainted than you. :) Something like
1/16 Cajun, 1/16 Black. :) Gad!

You know, chums. I just can't see getting myself killed
for guys like this Austin, dude. I just can't see it. If
there were only a few, I guess. But there are *so* many
now, who *deserve* free health care. They *deserve* safety,
etc, etc.

I mean, come on. Look around the world. Assuming we even
have another election, just look at places like Russia, or
South America. These places have come a long way. I wouldn't
be surprised if the people in Russia are more free than us by
2000. And they'll have finally *solved* their problems, while
the government here will continue running a huge deficit, etc.

It's just like the stock market. Buy low, sell high. I don't
see my U.S. citizenship going up much more in value. :)

It's a sad thing, but if Bill wants to brun Jim, well, why
should *I* stop it? I just can't see it.

I've been trying to talk my parents into relocating to Costa
Rica for over a year now. They keep arguing, but lately, well,
they've been keeping a more open mind. They didn't think Bill would
be *this* bad.

I tell you. If Uncle Sam can't get those interest rates down again,
we're pretty much guaranteed to follow Germany's depression example.

It may sound cowardly, but I just can't see endangering *my*
remaining 35 years. Not for these kind of people. Drug-dealers
maybe. Howard Stern, maybe. Not these.

Hello,

I am selling a ceramic resonator which doubles the scan/search rate of
the Uniden BC100/200/205XLT, PRO-35 and Regency R4020/4030 handheld scanners
to 41 ch/sec. Simple instructions are included. I had to buy in quantity
and am selling off the remainder. I have 11 left.

The price is $5 each, including shipping in the US. Please email
me for my address if interested. Thanks...

Here's the file I have on the cordless'.

Cordless Phone Frequency List for 46/49 Mhz Phones

Channel	Handset Transmit	Base Transmit
1	49.670 MHz	46.610 MHz
2	49.845	46.630
3	49.860	46.670
4	49.770	46.710
5	49.875	46.730
6	49.830	46.770
7	49.890	46.830
8	49.930	46.870
9	49.990	46.930
10	49.970	46.970

And from Gene Huges, author of Police Call:

Here are the PROPOSED new cordless frequencies (base unit):
1. 43.72 7. 44.12 13. 44.40
2. 43.74 8. 44.16 14. 44.46
3 43.82 9. 44.18 15. 44.48
4. 43.84 10. 44.20
5. 43.92 11. 44.32
6. 43.96 12. 44.36
The existing 10 channels would be renumbered beginning with 16.
Yes, these are currently assigned channels in the Motor Cariier Radio Service, but the FCC says they are so lightly used that there would probably be no interference to the currently licensed users.

Be aware that monitoring cordless phones may be against the law, Check your library for the laws in your state.

I personaly agree here, RG59 is too high an impedance for transmitting.
But 59 is better for listening, as it's got the less lose.
Here in the UK we have some coax that has similar dimensions, called
WESFLEX. It appears the military use it, and I try {we I can afford to}
use it here on my station.
They have diffent types for different frequency bands, but here the UK
price was 1.00 (plus tax at 17.5% now) a metre, about 1-2 years ago,
but it is good gear if you can afford it.

> a look at what services use the system it becomes clear.

<items deleted>

The new city administration has changed the policy imposed
by Mayor Young's regime which forbade the transmission of
locations of fire and police runs. With some exceptions,
the locations of most runs are now given.

Regarding the comments about trunked systems, much as I disliked
the former mayor, I really don't think his people were savvy
enough about communications technology to purposely move city
agencies to trunked systems for the purpose of evading monitoring
by citizens,IMHO. Would you also then say that encrypted MDT systems
also are implemented to prevent us from knowing what dispatch
was doing or the disposition of runs? I think these people have
communications needs beyond evading the folks at home with scanners.
The local news media don't monitor the public service frequencies all
that much either, judging by the quantity of reporting done on
local matters.It's now easier for them to get a CNN feed or newswire
than to hustle stories themselves,
but that's another newsgroup and another discussion...

Alex...Hello, from North of the Border. (Wheaton)

The DPS codes are actually published at the back of Police Call, both
1993 and 1994 editions. The DuComm signal codes are back there as well.

The codes to close out cases for DuComm are not published. The 9000
series codes are the same as the Illinois uses. (ICUR, or something like
that.) However, Wheaton and Glen Ellyn are using 7000 series to close out
their cases. Would you happen to have these?

The impedance of RG-58 is 50 Ohms.

This is the key point.

The impedance of RG-59 is 75 Ohms.

RG-59 is used generally for cable T.V.

You may use RG-59 with a scanner that is looking for 50 Ohm impedance, but, this will cause a slight impedance mismatch causing more loss of signal between the antenna and scanner. The only way to see how it works is try it; it wont break yor scanner since your only receiving. Transmitting is another story.

> car is at the same location how does the receiver know which microphone
> to listen to ? different frequencies or something like PL.

All of the ones I've seen advertised operate in 171 MHz area. Any
antenna you see are probably from some other radios they have as these
mics usually use small (couple inch) antennas that are built directly
into the receiver. An external antenna is available in at least one
catalog (the one I'm looking at right now), but from what I've seen
they are usually not used. Advertised original range: 150 ft.
With external antenna: 300 ft. (Now how often is the officer 300 ft.
from his/her car?)

As far as multiple cars at the same location, odds are that either
(a) the officers will turn off the extra mics or (b, and more probable)
the various inputs will just get jumbled together in the recording.
The transmitter/receiver pair has two channels, so it is possible to
switch channels, but how often do you think the officers both to
coordinate things like this, unless its a planned event (ie a raid, etc.).

FWIW, these are just short-range transmitter/receiver pairs and any of the
common/regular wireless mic freqs can be used. They are usually used in
conjunction with a videa camera, but are usually separate units.

Note that not all cars/officers are equipped with mics (for example, a
supervisor might not because he/she doesn't usually respond to a call
alone, but rather as a backup/command unit.)

Above is from reading ads in public safety catalogs and working with
the officers. I have no first hand knowledge of the exact operating
procedures involved, and various models vary. :-)

Hi Terry, if I needed to I could 'recycle' some old .750" trunkline for an ultimate (though 75ohm) feedline. Being in the CATV industry, I have access to oodles of roll ends, scrap/obsolete parts, etc. My No-gain Discone fed with 125' of RG6 (a slightly larger coax than RG59, still 75ohm, but lower loss) gets UHF/VHF from the San Francisco Bay area, which is 125+ miles away.
I can recall some outfit making balun/connectors to utilize 75ohm hardlines for transmitting. Saw an ad in a ham journal once.

Here is my two cents if anybody cares. Why should police encrypt their transmissions? What are they trying to hide? Your two bit 7-11 street hood is not using a scanner for his $20 dollar armed robberies. Typically his scanner would cost more than what he gets in a robbery, so logic sort of says if he has a scanner he is not a criminal of the type that police are trying to use for their arguments.
Next, I bet if you look at law enforcement statistics concerning scanner assisted crimes they would be nearly ZERO. These stats problably do not even exsist they are so negligable.
Next, the majority of police transmissions are the 10-8, 10-27, 10-28, code 7, etc.... Who really feels that Suzie Rottencrotch has some sort of constitutional right to have her traffic violations private?
Next, sure a lot of so called intelligence can be gathered on a PD disposition (ie location and number of unit on duty), but this info is obtainable in other ways as well, so why the money and effort at opsec?
I think a lot of the problem is these Mickey Mouse, poe dunk, Hazard County type PD taking themselves way to serious- thinking there some branch of the Secrect Service or James Bond. Tell me why for example Penn State University needs Motorola digital encryption system? A huge school, yes (35,000+ ?), but what crimes are on campus? Maybe two murders and a dozen rapes. Granted, serious crimes, but no real need for encryption is there? Yet they have this 20k plus system?
Yes the government does a lot for us, but they do a lot to use as well. Where were the internal checks for radiation testing in the 40's and AGENT ORANGE in S.E. Asia? The Justice Dept did not break Watergate. The examples of failed internal checks are countless.

Time to write some parking tickets around campus. I'll call you encrypted to set a time for lunch.....

3176. EXPERIENCE WITH GLASS MOUNT ANT.?

I use a glass mount antenna in my truck with a BC 200. The reception is MUCH better than with just the rubber duckie the scanner comes with, but it is nothing like the reception I get from my diskone at home.

By the way, can someone give me the name and number for Grove Electronics?

Regards,

Jeff

I liked your example, but I have heard over and over, that the PRESS must be allowed to monitor the trunked system. Usually the press is responsible for purchasing the trunked radio, and the city is required by law to program it for them. I'm not saying this is foolproof, but their comms are not going to be secure.

The reason few Hams know the origin, is because no one knows for sure. Many people claim different origins of this word, but there has never been universal agreement. There are several stories that sound convincing, but we will never really know.

>Also, could someone please explain exactly what is
>meant by a trunked system? (I've already heard the elephant
>jokes on this one so don't waste your time).

A trunked system is one that uses a group of frequencies and a computer to direct each of the radios on which frequency to use. When not in use, all radios monitor the "control" frequency. If someone on "channel A" transmits, the control frequency switches all radios set to channel A, to an unused frequency. When the repeater drops, all channel A users automatically switch back to the control frequency. This way, you can have only 5 frequencies, and many "channels" or fleets as they are sometimes called.

Thats the shortest answer I can come up with.

Get one of the volumes of <<Police Call>> from Radio Shack. Towards the
back of the book, there is a list of frequencies in numerical order along
with their allocation (public safety, railroad, red cross, federal government,
etc.). The cordless frequencies are in the 46 MHz range. To my knowlege,
there are ten pairs of "channels." One frequency is assigned to the handset,
and you will hear only the voice of the person using the phone if you tune into
this one (no fun). The second frequency is the base frequency, which is used
by the base (the part that plugs into the phone line) to communicate with the
handset. It carries both sides of the conversation. The listings in
<<Police Call>> make the distinction between base and handset frequencies.

Hope that helps.

Source record: 274979

I ordered my Yupi from Radio Lorenz last Friday and received it yesterday. My initial impressions are that this is an awesome unit. Compared to my DX-440 on shortwave, it seems to be comparable in sensitivity. I found that my telephone line antenna works great with the 7100, both on AM and shortwave. My initial BIG GRIPE about the unit is the built in delay of two seconds while in search or scan mode, whether you want it or not! This sucks for scanning trunked freqs. If you enable the delay function, it increases the delay from two to FOUR seconds! Do any of you know of a mod to get rid of the built in two second delay? I can't believe that the same folks who designed this wonderful receiver made such a stupid decision with this *feature*.

I have seen a number of posts recently about FireNet-type paging systems
for keeping posted about *hot* frequencies at any given time. There is also a
Monitoring Times article this month about using ham repeaters for the same
sort of thing.
Has anyone ever considered using the DX PacketCluster software to do
this? It is designed for just such activities, only normally the object of
interest is DX not hot frequencies. If having a ham license became a concern,
I am sure such a system could be operated on a business band frequency where
anyone willing to purchase a TNC could have posting access. Just an idea
for everyone to discuss!

Depends - what are you using it for? As far as signal loss, the RG59 has less than RG58. However, it's 75 ohm cable, so if you're using it on something that expects to see 50 ohm feed (like a transmitter), it's not the best stuff to use.

> using the net to distribute the plans for such a unit.

I don't know who the "many" are who are doing all this frowning, but they don't control either my system or the internet providers I connect to. If you're the one doing the frowning, read up on your newsreader, paying particular attention to the "junk this thread" and "kill this thread" commands (or equivalent).

I don't know if either the ECPA or the '94 scanner ban actually makes it illegal to modify a scanner to receive the "forbidden" freqs, but certainly it is not illegal to discuss the possibilities inherent in replacing the scanner's entire uP subsystem (the topic of my article to which you responded).

Look, if you are really concerned about the result of folks "using the net to directly further illegal activity", go complain to those whose *posts* are, in and of themselves, illegal... specifically, those who insist on posting megabytes of copyrighted pictures to the alt...pictures groups.

I have had some trouble in receiving AM broadcast channels. Channel 820 AM - a strong local radio station will come in sometimes, but more often than not seems to be dead on the MVT7100. The channel is clear through my car radio.

Are there any special keys that need to be pressed, asides from entering the channel 0000.820 and setting to AM reception? My thought was that the antenna that comes with the radio could be the problem.

Thanks for any help.

The antenna is the problem. Your car radio has an internal ferrite
antenna. The Yupi does not. The AM wavelengths are so long that the
short antenna that comes with the Yupi does not receive well below VHF.
There isn't much you can do besides connect an antenna designed for AM
(or medium wave) reception. There is nothing wrong with your radio! I
suppose they could have put a small ferrite bar in it but it is already
crammed for space.

David

P.S. I still think the automatic 2 second delay SUCKS!

Agree with most of the above, except for the second sentence. Internal
ferrite on a CAR radio? Inside a steel box? Come on....

Yeah, you're right. I was thinking about a typical portable radio. Sorry
for the brain dead statement. :-)

Anyway, a good antenna is the answer and I DON'T mean a telescopic whip!
I don't think they make them long enough. :-) Of course, an old car
antenna might work well!

If posters are insistent on continuing this thread on rec.radio.*, would you at least do us the courtesy of changing the subject heading to something with "guns" in it?

Just asking.

Richard, RIGHT ON! A government for the people by the people, NOT! It seems as the government we elect don't listen to the people who gave them their jobs. We did not elect them to run the government as they see fit, they are supposed to represent us, not dictate to us. I guess we need to become more involved in government and start our own lobby groups and NOT RE-ELECT those who think that they know what is best for us.

Why not vote all of the liars out of office and start over? Only re-elect the politicians that have a track record of voting the way their districts tell them. That's an idea, maybe the new electee's would do as we tell them, novel idea eh?

Americans for a FREE America..

My first scanner was a PRO-41. I used it for a year before getting
aPRO-46. The Pro-41 was fine for my original needs: monitoring police
and fire as part of a neighbourhood watch program. It was also
programmed for NOAA weather and the local Coast Guard SAR frequency.

As a tool it worked fine. Dropped iton the road a couple of times with
no problem. It does lack almost every moderm convenience. No air band
no scanning of a range of frequencies etc.

I still have it and the manual if you have any questions ask.

You're right. Your two bit 7-11 robbing hairbag won't be using
a scanner. But your more professional, know-what-they're-doing bank
robbers and especially, many of the medium level and higher drug dealers
often times use them.

>Next, I bet if you look at law enforcement statistics concerning scanner

In some areas, you're correct. There's a small town up here
called Paradise which is located at about 2,000 feet elevation in the
Sierra foothills just east of Chico (which is about 2 hours north of
Sacramento). They encrypt their transmissions a lot and as far as I'm
concerned, there is very little need other than suspect and victim
privacy when information is passed via radio. However, in the larger
cities (San Francisco Bay Area, Los Angeles, etc), I would understand
their use.

: Rich white boy gun collector <> holocaust victim. Sorry...
: arguments against gun control. How come you guys never use them?

He's making a very good point about the nature of incrementalism. What did you think was going to happen? Take a look at the tobacco wars for a good comparison. I'm not a smoker and don't enjoy inhaling other peoples smoke buthe way smokers have been gelded has not been lost on anybody.

Gun owners can be defeated in detail providing they can be split into camps by making seperate deals with each camp. If you are a hunter you should be worried about the presence of animal rights activists in the opposite camp. They DO want you to give up your rifle and shotgun.

You are definitely overreacting to the Niemolloer reference. It is a perfect reminder of divide and conquer tactics. I personally intend to defy every effort to disarm me. The potential for fragmentation and violence in this country along racial, ethnic, and sectional lines is not impossible nor is civil disorder or natural disaster ever far away. A decent military firearm should be in every Americans closet just like spare batteries and bottled drinking water. Assuming the assault weapon ban doesn't pass on this go round I'll have one of those Colt Sporters if they come back down under a thsouand dollars again and it'll be a private sale as well.

: The impedance of RG-59 is 75 Ohms.
:
: RG-59 is used generally for cable T.V.
:
: You may use RG-59 with a scanner that is looking for 50 Ohm impedance, but,
: this will cause a slight impedance mismatch causing more loss of signal between
: the antenna and scanner. The only way to see how it works is try it; it wont
: break yor scanner since your only receiving. Transmitting is another story.

Actually, the impedance mismatch from using 75 ohm coax, instead of 50 ohm,
is going to be minimal. Calculate it out - I think it comes to about 1.3:1.
Not perfect, but no problem - unless you are trying to push 1000 watts through
it.

We are not concerned about police scrambling their communications when they are working on a bank robbery. We are just concerned about everyday scrambling - which some areas are planning on implementing.

Whether police should even be involved with busting drug dealers is another matter.

I agreed with everything you said, up to this point. :-)

I have had the opposite experience, where an accident that I avoided because I heard it on my scanner was first broadcast over a local radio station about 20 minutes later. I was almost at work by then.

Let me see... A tactical unit is giving information over the radio. The
waco with hostages inside is listening to a scanner. I for one wouldn't
want this person to know what is going on... Most of the time, tactical
units don't use radios because of this problem, but this puts restraints
on their work...

This quick operating guide may make operating the CAMNIS HSC-050 a
little more convenient. It should apply to the Trident TR-2400, as
well (although I'm told it comes with a better manual). I _don't_
expect it to completely replace a reading of the owner's manual.
The information was extracted from the very poor, English version of
the CAMNIS HSC-050 owner's manual (except for a couple of items at
the end, under MISCELLANEOUS, for which CI$ HAMNETers get some credit.)

If you have corrections, or information to add, e-mail it to me and
I _may_ get around to correcting and reposting the original version.

I recently purchased a Pro-2006 scanner and have an antenna question.
I live in a third floor of an apartment building (top floor) and would like
to get an antenna that helps increase my reception. I don't like too far
from Offiut AFB (TAC's HQ) and would like to listen in but currently it
it scratchy.
Any suggestions as to what an apartment dweller could put up?

>Teenage burgalars, in fact, who would be _quite_ offended
>to be referred to as "boy."

The "kids" it turns out cased the house when the homeowner helped them
fix their go-kart a few weeks earlier. One of them was wanted for breaking
into cars on a car lot two weeks after his friend was killed.
The teenage burgalar that was killed had at least 15 prior arrests, some
convivtions (i'm not sure how many) ranging from breaking and entering to
armed robbery.

>Though the literal reading of the law forbade shooting
>under those circumstances, I don't consider the death
>of the burgalar to be lamentable. Do you?

The jury was hung (8-4 for aquittal) in interviews the jurors said they
weren't concerned if he was shot in the back they were only concerned where
he was shot (in the garage or when he was running accross the neighbors
yard) .
The Attorney General didn't feel he could get a conviction anywhere in this
state so he dropped the case.

BC2500 OWNERS:

I am at the point of making a decision on a scanner purchase and need your help. I have heard that there are some problems with this unit but no one has given me any specifics.

I think this unit has some good features over the Pro-43, but all I have heard is that the Pro-43 unit is superior to the 2500.

If you like your 2500, tell me why. If there are things that you don't like, let me know what they are. If there are things that don't work or frequently cause you grief, I would like to know about these too.

I am planning to make this purchase Saturday 4/30 or Sunday 5/1, so a quick response will be most appreciated.

Anxious to become a 2500 owner (I think),

Gary Buttari

<<Lots of inane, blathering, contemptuous, offensive nonsense>>

You're an offensive moron, and I resent your personal attacks, though I fully support your right to make them. I don't expect you to give a shit what I think, in fact I'd rather you didn't.

Life can be pretty good, if you don't spend all your time digging bunkers. You should come out of yours and enjoy it every once in a while. I knew this guy in college who spent an entire semester inside a 10'x10' shipping crate. He cut a little door in the side. If he had to use the bathroom he'd scurry across the lawn like a little rat to the dorm, then he'd scurry back to his crate. You remind me of him.

I'm probably taking my life in my own hands in saying this. You probably run over little children for fun.

Jim Austin

By the way, who is it that wants to "brun" me, and what exactly does that mean? Is this a gay sex thing? Sorry, I'm not into that.

P.S. Sorry for breaking my promise about not posting to r.r.s again on this subject, but this hurting fellow gave me no choice. I apologize to any whom I may have offended.

P.P.S I really don't care much for this flaming business. I'd much rather have pleasant converations. But like I said, this guy gave me no choice.

"SMR", Specialized Mobile Radio, I have seen it used in a lot places, sort
of a generic term for the New mobile radio services that have been
introduced over the last 4-5 years.

3226. Virtually new Icom R1 for sale.

Newsgroup: rec.radio.scanner
Date: 1994-04-28 18:33:26 UTC
From: Steve Willingham <swilling@harris.com>
Message-ID: <CozFJq.ELu@news.ess.harris.com>
Source record: 274907

I have recently passed my amateur radio Tech Licence exam and I will need to sell my R1 (which I dearly love) in order to buy a dual band tranceiver. Can't understand it, my wife just won't let me tie up more than a thousand dollars in radio equipment :-).

The R1 is virtually new. Purchased from Grove last Christmas for $459. It is still under manufacturers warrantee and includes a spare registration card to register the new owner. Internal batteries have had about 6 charge cycles on them. The unit is in perfect condition and includes the following accessories:
Standard:
Handstrap
Antenna (FA-4B)
Wall charger
Belt clip
Extras included:
BP-90 battery pack w/ 6 AA replaceable Ni-Cads (retail $19 + bat cost),
Protective Leather case fitted to R1 with BP-90 attached (retail $19).

I won't bore anyone with a listing of the R1's extensive array features, but anyone with questions is welcome to contact me. I'm sure everyone knows the R1 receives cellular with no modification needed.

TERMS:
Price for the whole package: $ 445 + shipping, COD-Cash, I will pay shipping insurance.

CONTACT:
Steve Willingham, E-Mail: swilling@harris.com or swilling@ic1d.harris.com
Voice phone: (407) 729-7204, (If I'm not in, leave message, I'll call back)

I was wondering about the availability of the Yupi 7100 in the USA....Is it totally sold out? I don't have the $ at the moment, but wish to get one hopefully fairly soon.

If necessary, I can drive to Ontario, Canada to get one. To Canadian users: where is the nearest Yupi dealer from the Detroit-Windsor area? I can't afford to drive a thousand miles, but (if necessary) will drive to Toronto if that's what it takes!

Thanks!

"Distribution: rec.radio.scanner" is not a valid distribution.

I believe the car alarm remotes operate in the 300 MHz range;
many are digital to prevent the sort of interference your friend
noticed.

>the hams were concentrating on their reports of conditions. I was
>impressed.

I was listening to 146.880, it certainly was exciting. I called a
friend in that area when the Weather Service guy on 2m said another
"circulation" was forming about 2 miles from her, and told her to take
cover (fortunately, they weren't hit).

>As the TV news talked of window damage, the hams were reporting
>vehicles flipped upside down wrapped up in power lines.

One thing bothered me a lot, though. Although Dallas/Ft. Worth now
has doppler radar which enabled them to broadcast a tornado warning
45 minutes before anything touched down, the reporting of the actual
tornado touchdown was very slow. Several hams reported that they
were being hit in Lancaster (suburb S of Dallas), giving exact
locations. The National Weather Service guy on the 2m band came
back a minute or two later to ask, "what was that location again?"
followed maybe 3-4 minutes later (!) by a report on the TV that
tornados had touched down in Lancaster. I assumed that within
seconds, a minute tops, of a report of touchdown, the TV weather
guy would break in. I know that people are supposed to take cover
when a warning is broadcast, but if it's 45 minutes in advance, I'll
bet very few people crawl into the bathroom closet and stay there
that long. People need to know when and where the tornados are
touching down, ASAP.

>My opinion of hams has changed. I used to think it was somewhat a
>useless hobby, where all people talked about was radio equipment.
>
>My hats off to all you hams out there.

Yes, the hams seemed to be a lot more efficient than the rest of the
agencies involved, despite _everyone_ patting each other on the back
the next day about how efficient they were. I mean, the ham repeater
moderator would ask the Weather Service guy "what's the current
location of the center of the mesocyclone," the WS guy would go, "OK,
I'll go check," and then report back maybe a minute later. Talk
about sneakernet... Another friend who's been scanning a lot longer
than I have says that "they've gotten better than they used to be."
Still, the delay between the ham coverage and the TV annoucements

just about made me scream with frustration...

AE> was somewhat less than the Pro 43, but the clutzy sales guy couln't
AE> find any specs on the Pro 51 so I could not compare features.

James...
The 51 is not comparable to the 43. The 43 is a triple conversion
receiver that is resistant to images. The 51 is not. The 51, though not
restorable for cellular, can pick up cellular using the image
method...program the scanner 21.6 Mhz up.

Jerry

3238. Pro-43 Vs. BC2500XLT

mi> I bought a Pro-43 scanner the other day and I like it but now that I
mi> have it I wish I had one that went down to citizens band. Now I'm
mi> thinking about taking back the Pro-43 and getting the BC2500xlt. How
mi> does the BC scanner compare to the the the Pro in terms of functions,
mi> price, quality, and modifiabilty for cellular?

Mike...Depends on where you live. If you live in a metro area, you will
not be happy with the performance. The 2500 has a tendancy to pickup
intermod, which is more severe than the 43.

Suburbs, slight problem, and rural areas, no problems.

There are alot more bells and whistles, such as 400 channel memory,
instant WX key, 100 ch/s scan rate, auto search and store, hit counter,
programmable priority (one in each bank, first 10 banks out of 20).

Jerry

I too live in Phoenix and listen to Phx, Glendale, Scottsdale & Peoria Police depts. Glendale uses a trunked system and Phoenix uses just regular. If a police unit is within about 3 miles I can hear them but other than that...nothing! They have really weak transmitters in their cars. They echo most things on some 400Mhz freqs and you can hear everything on those.

I recently issued a press release that the local police didn't
appreciate (only of the major local papers will be doing a story on
the topic soon). As a result, the police increased patrols in the
neighborhood from about once every two hours to twice an hour. Additionally,
they drove by the house slowly, taking a good look. Radio traffic
indicated that they were running all the license plates of cars in
the drive way (and marking them for "hold").

Later when discussing the matters with the Mayor, I told him about
the running of license plates. Twice, he asked how I knew. Twice, I
told him the police scanner. After the second time, he said "that will stop."
And, it did.

I posted about having trouble receiving AM broadcast channels about
two months ago. In the bay area 610 KFRC is no problem to get with
any ole cheapo radio, but I couldn't pick it up with my then brand
spanking new $600 Yupiteru MVT 7100! I thought my yup was defective
or not very good in the AM range. I'm glad somene else has the same
problem. I guess we can get a new antenna for AM. I want to get AM
to get the good news channels on AM in times of emergency (in CA we
get alot of quakes).

: anyone willing to purchase a TNC could have posting access. Just an idea
: for everyone to discuss!

A vary good idea. The state of California office of emergency services
transmits their emergency messages to the Broadcast media in the San
Francisco Bay area from Mt Diablo using ax25 Packet. The broadcast tv
and radio stations love it as they now have printed text to read. The
voice transmissions would be missed or squelched in the old days.

The system is made up of the same packet tnc hardware that is vary
popular in the amateur radio service. The same messages sent out over the
shared broadcasters 450. MHz repeater are also sent to a newsgroup here
on the Internet.

I'm looking for a glossary of amateur radio (especially short wave
& scanner) terms for a friend who is new to this hobby. He'd especially
like to know what terms like these mean: repeater, 22 megahertz repeater,
2-meter repeater, packet repeater, 2-meter ham ... those are just a few he
told me to ask about.

Is there a telnet or ftp site where I could get information about these
kinds of things?

Tony Safina -- Louisville, KY -- tony@iglou.com

To start...

Repeater: System which takes a signal on one frequency and retransmits
it, which greater power, on a different frequency (offset frequency).
Repeaters are usually located at high altitudes to permit reception and
retransmission for a wide radius.

22 megahertz repeater: A repeater which operates within the 22 megahertz band.
This would have to be an example, since 22 Mhz (abbreviation of megahertz) is
not an allocated area of the spectrum in amateur radio. A more practical
example for amateur radio would be a 2 meter repeater, or a 440 Mhz repeater.
In any case, the repeater would be 'coordinated' (the FCC has granted the
licencee/trustee of the repeater authority) to operate on a particular
frequency in the range of the band. For 2 meters, this would mean the repeater
might operate on 145.230 Mhz (2 meters = 144-148 Mhz).

Packet repeater (aka digipeater): A repeater which retransmits digital
signals from a TNC (terminal node controller = ham radio equivalent of a
telephone modem) usually using simplex communication (signal is retransmitted
on the same frequency it is coming in on).

2 meter ham: Since the spectrum is divided up into different parts by the FCC
(in this country), everyone wants to get their hands on the parts.
Amateur radio is no exception, and therefore has many 'bands' of frequencies

(frequency groups, such as 2 meters = 144 to 148 Mhz). The 2 meter ham band therefore consists of the frequencies from 144 to 147.995 Mhz, 20 meter ham band is from 14 Mhz to 14.350 Mhz, and so on).

There is more information in the rec.radio.amateur.* newsgroup FAQs on rtfm.mit.edu, /pub/usenet-by-group/rec.radio.amateur.<fill in the blank>

I would also be glad to field any more specific questions I am able to answer.

Scott

Herein is the gist of a message I've posted before...

Subj: Yupiteru MVT7100's for sale Conf: (283) rec.radio.sca

The Yupiteru hand held scanner/receiver was well reviewed in the October
issue of Monitoring Times. Since this unit is not legal to sell in the
U.S., the author recommended purchasing it in England from Javation.
There is a closer outlet for you Yanks tho!

Canada allows the legal sale of this unit and I am familiar with one
outfit offering it at a competitive price. Radio Lorenz in Montreal
will sell it at $749.00 Canadian plus shipping costs. Don't let the
price scare you, the Canadian dollar is selling at around $1.31 U.S.
which means that the price is lower than Javation's. Here's how to
reach them, if you're interested:

Radio Lorenz
482 St. Catherine St. West
Montreal, Quebec
Canada H3B 1A7

Phone: (514) 392-9200
Fax : (514) 392-4767

If you phone, ask for Helmut or Herbert Lorenz.

And no, I have no connection with this outfit other than as as a
satisfied Shortwave/Scanner enthusiast for the last four years. And yes
they have a catalogue of other (mainly SW eqt. and publications)
products.

As for the situation in the U.S that *requires* purchase in England or
Canada... long live the True North Strong and Free!!! <grin>

The info in this post is still current altho I have no idea how U.S. customs would react to the importation now that there's a ban. Still, Montreal is not far from the border.

>their use.

Paradise has crypto gear? Their department must have too much money.

Actually, I suspect that the main reason most departments don't
encrypt is that 1) the equipment is expensive and 2) key management
for a big group of radio users is a pain.

Key management is a big issue. If somebody loses a handheld, do
you re-key every radio in the system? Even routine key updates are a
headache. Does everybody have the same key, or are there communities of
interest? The military has struggled with this problem for decades, and
it's messy. Public-key doesn't work for broadcast systems.

Cell phone use is picking up in law enforcement, and if there's
crypto, it will probably be on the cell phones, where communication is
point-to-point and the key management problem is straightforward.
We may also see private cell-phone type networks used in some big cities.
Anything private will go over the cell phone system.

3256. Pro-43 vs. BC2500XLT

Newsgroup: rec.radio.scanner
Date: 1994-04-29 12:52:14 UTC
From: men0@ns1.cc.lehigh.edu
Message-ID: <1994Apr29.125214.115492@ns1.cc.lehigh.edu>
Source record: 274826

As noted previously, I owned two BC2500XLT, the first of which was replaced by Uniden for the second. I liked the features of the unit, including the display and audio, but it was rather insensitive, especially in low band and suffered terribly from intermode. As for the Pro-43, sensitivity is better, but it's more prone to intermode than the BC2500XLT, i/m/o. Other negatives include lousy audio and a small, poorly lit display that can't be read at night. There is a modification available that improves the Pro-43's audio, but I understand it also causes more "hiss" on reception. If I wasn't so disappointed in the BC2500XLT, I'd be upset that I'd bought the Pro-43. I'd look at something other than these two radios. I've always been rather puzzled by the rave reviews the Pro-43 keeps getting in this thread; whatever you buy, make sure you have as money back guarantee and try it out as soon as you get it!

3257. No Tenna Experience

Newsgroup: rec.radio.scanner
Date: 1994-04-29 13:00:16 UTC
From: men0@ns1.cc.lehigh.edu
Message-ID: <1994Apr29.130016.52833@ns1.cc.lehigh.edu>
Source record: 274827

I recently bought and installed a Grove No Tenna in my new Caviler (couldn't bear to drill holes or split the AM/FM radio). Installation was easy although you will need to remove the interior windshield trim on the passenger's "A" post in order to attach the antenna to the car body. In general the antenna is impressive except in UHF, where it absolutely kills most signals. Grove technical assistance thought the the antenna might be de-sensing due to strong signal load, but I don't think this is the case. UHF is received very poorly on this antenna but booms in load and clear with a magnetic mount antenna. By the way 800 reception from near-by Bethlehem City is great! Like most things, it depends on what you're trying to do but if you have to stealth, the No Tenna may be a way to go. By the way, I tested with a Pro-43 in the following areas: Allentown, Harrisburg and Philadelphia, all in PA and also in NY,NY.

From: parnass@ihlpf.att.com
Message-ID: <Cp0yB8.Ir8@cbnewse.cb.att.com>
Source record: 274910
Cross-posted to: rec.radio.scanner,alt.radio.scanner,rec.radio.info

Last changed: March 16, 1994 |

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part in bulletin boards, networks, or publications which charge for service without permission of the author. Free distribution is encouraged.]

This introduction is intended for people new to the scanning hobby and is oriented to scanning in the USA. It tells where you can buy your first scanner, what features it should have, where to get it repaired if required, how to get frequency information, and mentions a few scanner clubs worth joining.

Why Scanning?

Every day and night, scanner hobbyists are entertained by what they overhear on their radios. Police cars, fire engines, ambulances, armored cars, trains, taxis, airplanes, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss strategy with his advisor from a 415 MHz radiophone in Air Force 1, or a team of G-men protect him while transmitting in the 167 MHz range?

Listen in the 46.61 - 49.97 MHz range to your neighbors deal drugs over their cordless telephone, or as their conversations are picked up and transmitted over the airwaves between 49.67 and 49.99 MHz by their sensitive baby monitor intercom.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots.

Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

You can even listen to the order taker's wireless microphone at the local McDonald's restaurant on 154.6 and 35.02 MHz!

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the ECPA. Change is in the wind -- it will soon be illegal for companies to sell scanners which cover the cellular phone frequencies, but sales by private individuals will still be allowed.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have recently enacted laws against listening to cordless phones, but it's currently legal to listen in most states. You can find out about these restrictions in a 39 page paperback, ANARC Guide to U. S. Monitoring Laws, compiled by Frank Terranella, available for $7.50 from ANARC Publications, P.O. Box 462, Northfield, MN 55057.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners bear the Realistic label but are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend AOR brand scanners.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you

get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners almost always provide more audio than portables, and portables are usually more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band unless you live in a very rural area where this band is not used. Usage of the 800 MHz band is growing by leaps and bounds.

If you're not sure whether you'll like scanning, don't want to spend much money, a 16 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often poor.

Deluxe scanners can be controlled by a personal computer, although this feature isn't important to most scanner owners.

Currently, the more popular scanners include the Uniden/Bearcat 760XLT (a/k/a 950XLT) and Radio Shack PRO-2006 base/mobiles, and the Uniden/Bearcat 200XLT (a/k/a 205XLT) and Radio Shack PRO-43 portables.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so. Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801, can extend reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and

ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be somewhat more prone to lightning strikes because they are not at "DC ground."

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores like Service Merchandise and Circuit City sell scanners, but carry just a few models. Department stores, like Sears and Montgomery Wards, sometimes offer scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 300 S. Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- National Tower Company, PO Box 15417, Shawnee Mission, KS 66215. Telephone (913)888-8864.

- Marymack Distributing (Katy, TX) sells Radio Shack scanners at discount. Telephone (713)392-0747.

Many ham radio dealers, like Amateur Electronics Supply (Milwaukee, WI, (800)558-0411), also sell scanners.

Used scanners may be found at hamfests, flea markets, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

If you are handy with a soldering iron, you may be interested in modifying your scanner to add features or enhance its performance. Be warned this usually voids your warranty. Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

ftp.cs.buffalo.edu
garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117) |

KD4MOJ maintains a scanner modification server for people | without FTP access. You can request a list of scanner | modifications by sending electronic mail with the words GET | INDEX.TXT to FTPmail@exchange.tlh.fl.us

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here are least two companies which repair scanners:

1. Electronic Repair Centers (telephone 708-455-5105) - Several people have been pleased with good repair service from Electronic Repair Centers in Franklin Park, Illinois. Although they are not authorized to perform warranty work, this outfit has been repairing Bearcat scanners for several years. They charge a flat rate of fixing scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

2. G & G Communications (telephone 716-768-8151) - This family owned company repairs scanners and stocks parts for several older models. G & G sometimes buys old scanners, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is the Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores.

I also recommend the book, Monitor America, 2nd edition published by SMB Publishing, and available from Grove Enterprises for about $25. This single edition contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's 168 page Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 6th edition is available from Grove Enterprises for about $19. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200) and Kneitel's sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

Grove enterprises sells FCC license information on floppy disks. Disks for each state are sold separately, and the information is basically the same as the FCC "state sort," i.e., transmitter location (state/city), callsign, licensee name, and type of license.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio users to identify their operations with their assigned call letters, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immedi-

ate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

The world's largest scanner club is the Radio Communications Monitoring Association (RCMA). Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are $24.00 per year, which includes the monthly RCMA Journal, which consists of approximately 95 pages. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz.

Inquiries about RCMA membership should be sent to RCMA General Manager, P.O. Box 542, Silverado, CA 92676, USA.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,

Springfield, OH 45503.

AOSC questions can also be sent electronically to:

rccons!aosc_hq@telerama.pgh.pa.us or
dave.marshall@f240.n108.z1.fidonet.org.
FidoNet: 1:108/240.0

AOSC also has a MEMBERS & EDITORS Scanner related echo, AOSCNet, distributed via FTN on 6 BBS systems, and via Internet Mailing list. Rick Christian advises these strict rules for the AOSCNet Scanner Radio Echo (as of 2/1/94):

1. No discussion of cellular modifications or discussions on how to monitor cellular transmission.
2. No discussions on topics which would violate the ECPA '84, TDDRA '93, (18 USCA 2510 et seq.) or Communications Act 1934 & 1984 as amended (47 USCA 705), i.e., decoding/reception of paging, cellular, encrypted stuff, descrambling etc..
3. No Aliases.
4. No discussion of Shortwave or Amateur Radio material (except SAREX).

For info on the ECHO only, contact:

R.E. Christian, AOSC PA/AOSCNet Founder
PO BOX 12763,
Pittsburgh PA 15241-0763.
FAX: 412-831-5860.

Internet: rccons!aosc_pa@telerama.pgh.pa.us
rccons!aoscnet_hq@telerama.pgh.pa.us
rick.christian@f220.n129.z1.fidonet.org
FidoNet: 1:129/220.0

To receive a file of info on the All Ohio Scanner Club via Internet send to: rccons!ftpmail@telerama.pgh.pa.us

In body: get aoscinfo.zip

This will send a UUENCODED info packet to you. The file contains an outline of the material you will find in the American Scannergram, the AOSCNet, and an application for membership. (Note: This file will not be sent back to *.fidonet.org addresses.)

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members sometimes sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. A one year subscription is available by mailing a $10 check, payable to Kim Moran, to:

The Command Post
attn. Kim & Ted Moran
6143 W. Touhy Avenue
Chicago, IL 60646

Many CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (708)852-1292.

Here is a tentative meeting schedule for 1994. All meetings will be held on Saturdays at the Destiny Restaurant, 1440 Rand Road, Des Plaines, IL:

February 19
April 16
June 18
August 13
October 15
December 10

Bring a notebook and your appetite.

In <2ppjdt$qfl@panix2.panix.com> schuster@panix.com (Michael Schuster):

|>I was wondering about the availability of the Yupi 7100 in the USA....

|ACE Communications advertised them for a while, and actually delivered two
|or three ... but orders now are taken with an infinite back order status.
|Don't expect to get any from them soon ... their application for FCC
|approval on a modified (cell locked out) MVT-7100 was denied months ago!

What was the FCC reasoning behind this? Presumably, ACE would have made
sure that the "modified (cell locked out) MVT-7100" met the letter of
the law concerning a scanner that was easily modifiable via adding a
diode, cutting a wire, etc. Is there some unstated FCC regulation that
ACE could not fulfill via it's implimentation of not-easily-modifiable
to cell freq scanner?

3260. What is the status of the AOR AR-1000 now?

Cross-posted to: rec.radio.scanner,alt.radio.scanner

Now that April 26 has passed, what is the current status of this scanner vis-a-vis the FCC cell scanner ban?

(1) Are they still being imported?

(2) If they are still being imported, what frequency ranges are cut out? Note that ICOM will slice out 800-900Mhz on the R7100 to fulfill FCC regs. [What does it take to restore an R7100 to full coverage? If it is a single IC, will someone import these into the USA? If not, perhaps some enterprising company in the UK or AUS could sell them direct to the US via Federal Express...]

(3) If the AR-1000 is simply shipped with the EEPROM's programmed with the cell frequencies sliced out, is there any physical impediment to reprogramming the EEPROM's via moving a few wires and punching in the frequency limits on the keyboard, as reproduced in Bornstein's "Guide to the AR-1000"?

Does anyone have any experience with RG213U cable ? I am told this is a very low loss cable. If anyone has specifications on RG213U how does it compare to RG6 and RG8. Which cable would you use for the 800 - 900 Mhz frequencies ?

Thanks

I have the Radio Shack weather alert and it works great. Got it
for $20.00 on sail. I get the local station from 40 miles easy.
Works well inside my apartment building. 3 channels. Alert mode.
I tested the current draw in aleart mode and I think it would
run for 2 weeks or so continuously on new batteries.

I just got some info from Mototola and have some questions. ASTRO is a line / model of radio that comes in both mobile and handheld versions correct? One of the featuress of the ASTRO radios is the ability to encrypt correct? SECURENET is a different type of encryption and is an optional feature for the ASTRO correct? So is it correct to say that Motorola has two encryption methods, one built into the ASTRO and one that can be bought as an option (SECURNET)?

If these are two different encryption methods (ASTRO/SECURENET) which is tougher to break? Or are they the same? Motorola's add claims that there are so many possible codes that if you tried 1 million a second, it would take 75 million years to get thru them all. Does this number seem right? If so, how was it calculated? The add for the ASTRO says the radios have an encryption algorithm capacity of 2 algorithms per radio and 16 encryption keys per radio. What is this telling me?

>
> Matt

Hello Matt,I also live in an apartment,but Im on the fourth of four floors. Its nice to be up here.If you have a balcony with a solid wall its a lot easier to hide antennas,but if there is a see-thru railing its tough.I currently have a Antenna Specialist's MON-58 antenna on a 5 foot mast hang -ing over the wall.Its not perfect but it works ok.I get away with this because when the management complained,I asked if they were going to do the same with all the other tenents?This stopped them cold!Many of the folks who live here have an assortment of balcony-mounted items such as planters,etc.Keep this in mind.If its mil-air you want to listen to the best antenna will be the discone,due to its wide bandspread.Some of the discones are bigger than others but radio shack sells one that would work for you.The only drawback to the RS discone is its not much use below 100 MHZ. because it has no low band element on top.If you decide to use a discone,and wonder how to mount it,there area couple of ways.One would be to cut a mast tall enough to mount the antenna on,and then use a medium sized tree planter filled with rocks or dirt as a base.Another way would be to get a beach umbrella stand,maybe even a christmas tree stand would work, Im going to have to try that myself!Well good luck and good listening!

Don't you see the difference? They didn't just privately listen in their own homes for their own entertainment. They collected and distributed evidence of their own ECPA violations.

I just purchased one. I think it's great (though I have nothing against which to compare it. BUT, the audio is not great, I wish it would automatically store frequencies and then continue looking when searching for new frequencies and it has a weak belt clip. I'd still buy it.

Now that April 26 has come and gone and many of the 800MHz capabable units will be picked up on the used market, it would be useful if some one with quick access to the information would post a table listing all of the major brands and models and whether they were 800MHz restorable *with the appropriate steps*. Many would like to have such a ready reference to use at flea markets, tag sales.

Hello All!

If your a scanner user in ANY part of:

Western PA (Erie, Butler, Washington, Waynesburg, Altoona, Johnstown, Pittsburgh)

WV Panhandle (Weirton, Wheeling)

Northern OH (Columbus, Cleveland, Youngstown/Akron/Canton, Toledo, Mansfield).

AND

Your interested in participating in a Scanner User Notification system please contact me via netmail/email to get more info.

I am presently forming a group for a system in these areas. We NEED MEMBERS & DISPATCHERS. This system will employ Motorola Advisor Alphanumeric pagers.

If your not familar with a scanner notification group refer to the 4/94 issue of Popular Communications for more info.

PLEASE reply via email/netmail ONLY!

Information on pricing etc. may be obtained by sending a message to:

rccons!pagenet@telerama.pgh.pa.us

This will return an ASCII message with info & updated info as received.

Rick Christian, AAJP/BSEE
Internet: rccons!rec@telerama.pgh.pa.us

Actually, the main reason for denying certification was that the radio
generated too much stray RF.

Surely, then, you missed my "non-rave review" from long ago:

==========

As a long-time AR-1000 owner who has looked over the fence at the
PRO-43, I must temper the unregulated enthusiasm over the PRO-43
with some personal observations. (Yes, I, too succumbed to the ethic
that you can't have too many scanners).

First, the PRO-43 scans faster and obviously has more useable
sensitivity than the AR-1000. It also has smaller memory banks which
are easier to manage. However, it could use 40 more such banks.
Fine. Now for the negatives.

If this is a triple-conversion scanner, why are 160-161 MHz filled
with interference from pagers and television audio? I thought this
was the scanner which was billed as being free from images.

After using the AR-1000 it's almost impossible to live with only one
set of search limits. Furthermore, the PRO-43 doesn't have a "search
and STOP" function which will stay on a frequency of interest. Of
course you can always turn off the squelch to make it stop searching,
or hit the MONITOR button to store it ... but at the rate this radio
searches, what if your fingers aren't fast enough? Searching through
frequency ranges having birdies is particularly difficult, compared to
the AOR or ICOM scanners, because there is no way to lock out
individual frequencies during a limit search.

For a modern microprocessor-controlled scanner, the data manipulation facilities are terribly weak. For instance, there is no way to simply punch in and listen to a frequency without entering it into a memory channel. To add insult to injury, you can't manually write into the scratchpad "monitor" channels unless you're in the middle of an automated search. Nor is there a way to clear out the monitor channels without resetting the scanner.

I =really= miss the VFO knob on the AR-1000; in fact I constantly reach for it (non-existent) on the PRO-43 out of habit. And there's no functional equivalent, either. In search mode, even with the squelch open you cannot use the up-down buttons to reliably step through the search range. Why? "Zero-Matic" keeps intruding, trying to track the center of a signal many kilohertz away.

The squelch makes an annoying thump when it opens, and an even bigger thump when it closes. Unlike other users, though, I don't find the so-called "bassiness" of the audio to be a problem.

The LCD display is pitifully small. Even the ultraminiature ICOM R-1 has bigger numerals! The dial light should be CPU-driven like the R-1. Press the button, it should stay lit for 5 seconds. Press the button again within those 5 seconds, it should go off. Press any OTHER buttons during those 5 seconds, it should continue to stay lit for 5 seconds after you stop pressing other buttons. Does it? No.

The belt clip feels so flimsy I'm afraid to use it for fear it will break off. And why, on their best handheld, do they still use the cheapest type of center terminal for the BNC connector? The buttons are too tiny, too, and their travel when depressed is too short to provide positive feedback (I guess that's what the blasted beep is for, eh?) I also expect the white numerals to fall off the buttons, aided by friction from the walls of The Pouch that I store it in. Thankfully, however, that hasn't happened.

Now don't get me wrong ... I'm basically happy with this scanner and don't intend to return it (especially after microsurgery!) but I really felt it necessary to balance the scales here.

==========

Now, do you feel better? :-(

3283. Spectrum Show 30 Apr 94

Newsgroup: rec.radio.scanner
Date: 1994-04-30 13:34:51 UTC
From: bigsteve@dorsai.dorsai.org
Message-ID: <h1bmjGG8y9O1057yn@dorsai.dorsai.org>
Source record: 274837
Cross-posted to: rec.radio.shortwave,rec.radio.amateur.misc,rec.radio.scanner,alt.radio.pirate

This is to let everyone know that my news segment on the Spectrum program that was heard via WWCR/5810Khz, on 4/30/94, (US Time), was originally prepared for the previous weeks program. It, and all the other segments, were delayed one week by an arbitrary management decision to present a "listener appreciation" program last week.

This means the news item, (IL scanner bill), is definately out of date. We were not able to update the report since Dave was in Dayton.

The prerecorded segment also states that we will be taking more entries to rename the segment. Sorry, but due to commitments next week, I will not be able to extend it, it ended on its original schedule, today. The winner is Dave Chapchuk who snail mailed in the suggestion SPECTRUM ANALYSIS.

- - -

Here is a hardcopy of this weeks Spectrum Analysis.

Well it seems appropriate that for our first commentary we will be discussing Bootleg radio. Now we've been calling it Pirate radio for the longest time, but when you get down to it, it has had numerous names over the course of time. The latest attempt to rename illegal broadcasting is Micro Radio.

As the name implys, Micro Radio means low power operations, usually 10 watts and under. Unlike Pirate Radio as we know it, Micro Radio is being touted more as a political entity, not the "for fun" and ego-tripping form that Pirate Radio is. The chief advocate of Micro Radio is Stephen Dunifer, a former guest on this program. Dunifer is a product of 1970's Berkley, California, where he still lives and is considered to be a former political radical.

A few weeks ago Dunifer published what I consider to be his manefesto on the Internet called, Take Back The Airwaves. While I didn't agree with some of what he said, it did inspire about 50 comments by other users that discussed many of his ideas. The ideas covered everything from how licensed broadcast stations are playing to the largest audience to get the most money and have no intention of serving the minority interest of the community to how Micro Radio would be a true democratic representaion of the populace.

One of the repliers was Bob Smith, the host of a radio talk show on a Rochester, NY, AM station who was interested in finding out more about the various aspects of Micro Radio. Instead of being welcomed as a possable supporter of the idea, within the media, he was blasted by one individual who claimed that Bob was part of the problem. The poster went on to

further say that Bob was reaching his audience, but the poster wasn't because he did not have the money to buy a station. Bob was further ripped for having an audience which meant the owners could sell the advertising time, which meant that Bob could continue to reach his audience and the advertisers would buy more time. The poster went on to say that Bob was monopolizing the airwaves and had the nerve to solicit suggestions on how to make his air time more useful.

Sound familiar? No? Well does the old, "you are a tool of the establishment" argument from the 1960's ring a bell? How about the, "It's people like you who are continuing the war," statement? Good Lord, I though we were finished with this self righteous, radical, flower-power trip a generation ago, but I see the attitude has manefested itself in another way. Comm'on folks this is the 90's, not the 70's, the revival of Hair is on the stage, it shouldn't be in the streets too.

Now as one who is a former staffer of politically orented broadcaster, Radio New York International, I should talk, right? Yes, I was there during the Liberal period of Randi Steele and the "Dump Bush" time of Pirate Joe, but this attitude is childish. It is an attitude that is a detrement to Micro Radio. Hasn't anyone learned the lesson of RNI?

You can't lobby politicians by saying I want the 10 watt Class D station license reinstated so I can hear Joe Shlamengie talk, if Joe Shlamengie is on the FBI's list of subversives. In the words of the hippie generation's troubador, John Lennon, "But if you're going to carry picture of Chairman Mao, you ain't gonna make it with anyone, anyhow". It's time to really put the idea of community radio back in the hands of responsable parties. Even the most liberal of congressperson is not going to open a pandora's box of supporting licenses on the idea of it being a 1st Ammendment right of the individual.

If you want to start a movement for the issuance of these low power licenses, a community radio broadcasting band, or any other type of local communication facility, then it's time to put your support behind responable community agencies. Outreach programs, neighborhood youth and senior centers, churches and temples, support groups, chambers of commerce, and even the local High School; they are all the kinds of public institutions that would be the most politically acceptable to operate these Micro stations. Joining, supporting, and convincing these institutions that Micro Radio could be a way of extending itself out to the community is the way to go in my opinion.

If you were to ask those politically radical individuals of the 1960's and 70's, you'll find that most of them, people like Abie Hoffman, Tom Hayden, and even Jessie Jackson, decided to work within the system to bring change. Being a radical, especially when trying to tackle the FCC, is not going to make it with anyone, anyhow.

The "delay" button can be selected when doing a limit scan. Gives me plenty
of time to hit the "monitor" button to stop the scan.

3287. Centracom Console For Sale

Newsgroup: rec.radio.scanner
Date: 1994-05-01 00:12:16 UTC
From: daryl@tcomeng.com
Message-ID: <2pus50$qmc@tcomeng.tcomeng.com>
Source record: 274841
Cross-posted to: misc.emerg-services,alt.law-enforcement,rec.radio.scanner

I have a self-contained tabletop Motorola Centracom I console for sale. It is equipped with 7 TR modules that can be optioned for tone or DC remote control. The unit is in excellent condition and looks like new. This is functionally equivalent to the Centracom Series I console equipment that mounts in free-standing console furniture.

I refurbished the unit about a year ago and have been using it in my office every since. It works fine. This unit would be ideal for a small police or fire department or for an EOC. Here is an opprtunity for the scanner enthusiast to have the ultimate toy at home.

Asking $3500.00. Will consider trades for interesting comm or computer stuff.

*** Welcome to rec.radio.info! ***

Welcome to rec.radio.info, a group that aims to provide a noise-free source
of information and news for the entire rec.radio hierarchy.

Two introductory articles about rec.radio.info are posted to the group and
to news.answers every two weeks. You are now reading the first article, which
explains what rec.radio.info is, and answers some Frequently Asked Questions.
The second article is titled "Submission Guidelines", and you only need to
read it if you want to submit an article to rec.radio.info.

You can skip to the next section of this article by searching for the next
" -- " string. The sections available are:
- What is the purpose of rec.radio.info?
- Why are messages almost always cross posted to rec.radio.info?
- What is a 'follow-up', and what does 'moderated' mean?
- OK, so now I know what 'moderated' means. Tell me more.
- What type of material is considered inappropriate?
- I do not have access to news, how can I get the information posted to
rec.radio.info?
- Will the material appearing in rec.radio.info be archived somewhere?
- I have a regular posting with timely information, is there a way to
speed up it's delivery, or automate for more convenience?

-- What is the purpose of rec.radio.info?

The purpose or charter of rec.radio.info is to provide the Usenet community with
a resource for information, news, and facts about any and all things radio.

All the other rec.radio groups are intended for discussions and general chit
chat about radio. Rec.radio.info will contain informational, factual articles
only. Follow-ups are redirected to an appropriate other group, and further
discussion (if any) will not take place in rec.radio.info.

In order to ensure that rec.radio.info contains only appropriate articles, it
was decided to create the group as a moderated newsgroup.

-- Why are messages almost always cross posted to rec.radio.info?

It provides a "tag" for each article to be assembled into a filtered
presentation in rec.radio.info (even with cross-posting, only one message, with

a unique Message-ID, is propogated across the net). This tag also facilitates a pre-existing method of dropping or cancelling the articles locally within the discussion groups if you don't want to see them. This accommodates individuals who want to separate the bulletins from the discussions, discussions from the bulletins, as well as those who are adamant about not reading another newsgroup and wanted to see everything all in one basket.

With the total size of Usenet (in number of newsgroups and total traffic) doubling every year or so, this is no insignificant contribution to reducing information noise and chaos. Making the discussion groups a catch-all, and making extra newsgroups filters on that catch-all, is also the most realistic way to implement such a scheme (It's not intuitively obvious what the charter, contents, and general appropriate topics for each and every newsgroup are. Seeing FAQ's and charter/intro postings in the home newsgroup is beneficial for new readers).

By cross-posting one only is adding a few tens of bytes to each bulletin (to specify the extra group on the Newsgroups line), but are adding the capability for very powerful filtering features available on most news servers, listservers and readers. Your local news guru could probably explain these features in more detail.

In rn, for example, according to Leanne Phillips in her rn kill-file FAQ, add a line of the form:
/Newsgroups:.*[,]rec\.radio\.info/h:j
either in ~/News/KILL (if you don't want to see rec.radio.info articles anywhere) or ~/News/rec/radio/amateur/misc/KILL (if you don't want to see them just in rec.radio.amateur.misc). The latter method means your kill file will only be consulted during rec.radio.amateur.misc (and hence runs more efficiently), and will probably work for most people.

In nn, according to Bill Wohler in his nn FAQ, add a line of the form:
rec.radio.info:!s/:^
in ~/.nn/kill (if you don't want to see rec.radio.info articles anywhere), or put the following lines:
sequence
rec.radio.info
rec.radio.
at the end of ~/.nn/init in order to see all the rec.radio.info bulletins first, then read the remaining rec.radio.* without the bulletins.

-- What is a 'follow-up', and what does 'moderated' mean?

If you are new to Usenet and are not familiar with the terminology, you might want to read the general introductory articles found in the newsgroup news.announce.newusers. Doing so will make your life on the net much easier, and will probably save you from making silly beginner's mistakes.

If you think that at this moment you are reading an echo, a conference, or a bulletin board, I'd also strongly suggest a trip over to news.announce.newusers.

For the rest of this article, I will assume you have a basic knowledge of Usenet terminology and mechanics.

A moderated group means that any article that needs to be posted to the group has to be accepted by the moderator of the group. Since we need to ensure that followups to an article (discussion) do not show up in the rec.radio.info newsgroup, the `Followup-To:' header line contains a newsgroup that is appropriate for disussions about the specific article.

-- OK, so now I know what 'moderated' means. Tell me more.

Rec.radio.info is a moderated newsgroup, which means that all articles submitted to the group will have to be approved by the moderator first.

The current moderator of the group is Mark Salyzyn. Submissions to rec.radio.info can be posted, or e-mailed to:

rec-radio-info@ve6mgs.ampr.ab.ca

Comments, criticisms, suggestions or questions about the group can be e-mailed to:
rec-radio-request@ve6mgs.ampr.ab.ca

But before you do so, please be sure to check out the "Submission Guidelines" article.

The influence of the moderator should be minimal and of an administrative nature, consisting chiefly of weeding out obviously inappropriate articles, while making sure correct headers etc. are used for the appropriate ones.

-- What type of material is considered inappropriate?

There are three broad categories of articles which will be rejected by the moderator:

1) Requests for information: rec.radio.info is strictly a one-way street. I receive information in my mailbox; I then post it to rec.radio.info. Requests for specific information belong in the normal discussion newsgroups. If your request gets answered, you might consider passing the answer on to rec.radio.info, though. Especially if you can edit it into a informational, rather than a discussion, format.

2) Obvious discussion articles, or articles that appear unsubstantiated.

3) Commercial stuff: a relatively unbiased test of a radio product would be accepted, but any hint of for-profit might be reason for rejection. For three reasons: This is not the purpose of the list, for-profit is a controversial topic, and this list may be passed onto Amateur Packet Radio (where for-profit is prohibited except under certain provisos).

rec.radio.swap (or possibly comp.newprod) may be more deserving of the posting in any matter.

Similarly, copyrighted material generally cannot be used. If it's TRULY worthwhile to the net, I would recommend obtaining permission from the copyright holder. Please note the source, and if permission was given. I

reserve the right to make the final decision concerning appropriateness in all situations. In most cases, a brief summary of, or pointer to, the copyrighted information may be all I can allow.

-- I do not have access to news, how can I get the information posted to rec.radio.info?

brian@UCSD.EDU (Brian Kantor) has kindly supplied a mail list server for rec.radio.info. Non of the articles will be digested, due to their size, so you will receive individual mailings for every article posted to the group.

Mail sent to radio-info@ucsd.edu will be forwarded to the moderator and thus is an alias to rec-radio-info@ve6mgs.ampr.ab.ca

To subscribe and unsubscribe via the listserver; the format for that is

sub address radio-info
unsub address radio-info

where 'address' is your full mailing address. Send this request to

listserv@ucsd.edu

Note that the server will automatically delete any address that bounces mail. If you leave the address portion blank, it will try to deduce your address from the mail headers. This may not work if you are on bitnet, milnet or some other non-Unix host, so it is recommended to put your return address in any case. For example:

sub mymailbox@myhost.mydomain.mil radio-info
or
sub MEMEME01@DMBHST.bitnet radio-info

or something like that.

-- Will the material appearing in rec.radio.info be archived somewhere?

Yes. Still firming up details at the moment but here is a preliminary list:
- unbc.edu as maintained by Lyndon Nerenberg <lyndon@unbc.edu>
- nic.funet.fi maintained by Risto Kotalampi <rko@cs.tut.fi>
saved to /pub/dx/text/rec.radio.info currently stored as numbered files.

Effectively this means that anything you post to rec.radio.info will be permanently stored, so your work will not be lost.

-- I have a regular posting with timely information, is there a way to speed up it's delivery, or automate for more convenience?

Yes, there is! It may take a bit of chatter with the moderator, but we are willing to take responsible people and provide them the means of posting the articles directly from their site. We will try everything we can as we fully realize that DX (distant signal) and astronomical data can be somewhat transitory. We are also willing to allow regular posters of information the same courtesy, even if the information is not as time critical.

We refer to this as self-moderation, which is partly based on the model for news.answer. This requires co-operation and good will to be beneficial to the community in the rec.radio hierarchy.

I suggest reading the posting guidelines for more information. I am open to suggestions.

I thank the following individuals for their input into this article:
rec.music.info moderator Leo Breebaart rec-music-info@cp.tn.tudelft.nl
rec.radio.broadcasting moderator Bill Pfeiffer wdp@gagme.chi.il.us
Paul W. Schleck, KD3FU pschleck@unomaha.edu

3289. FCC License Data Sources

Newsgroup: rec.radio.scanner
Date: 1994-05-01 07:00:16 UTC
From: bill@thd.tv.tek.com
Message-ID: <2pvk20$kei@news.tv.tek.com>
Source record: 274845
Cross-posted to: rec.radio.scanner,rec.radio.info

[last changed 08-Apr-94]

Changes preceeded by "|". Please e-mail corrections and additions to me.

INTRODUCTION

This is a list of FCC license data sources available to scanner listeners. The FCC master contains a wealth of data about every non-government license in the United States. Most of the sources below contain a subset of this data, although a few contain all of it. Government licenses are not administered by the FCC, and the data is not available to the public.

If you are interested in purchasing the data, you might want to consider forming a co-op of people in your area to share the cost. As far as I know, this is legal since the information is in the public domain. However, most software supplied to view or manipulate the data is copyrighted and must be purchased separately by each user.

Prices are rounded to the nearest dollar and include shipping, if known.

C.E.T.

CET sells records of all stations inside a 30-mile radius for $80. (Major cities cost extra.) A 70-mile search costs $178. The data is provided on floppy disks and is available in ASCII columnar and comma-delimited formats.

CET does not provide data for licenses that do not contain specific geographic coordinates (i.e., mobile-only systems) or specific operating frequencies (e.g., amateur radio).

To do the search, CET requires the latitude and longitude of the center of the 30-mile radius. I calculated mine from a USGS topographic map I obtained at a local nautical supply store. Alternatively, you can obtain the coordinates for your town from the University of Michigan's geographic name server. Run "telnet 141.212.99.9 3000" and enter your zip code. For my area, the server returned the coordinates of the main post office.

CET can be reached at 800-445-0297.

GROVE

Grove sells FCC data on disk by state. The first state is $40, and each additional state is $30 (add $10 for CA, FL, TX). The disk comes with a database search program. Grove Enterprises can be reached at 800-438-8155.

MICROFICHE

Lee Reynolds (lee@tosspot.sv.com) has made available copies of the entire FCC master on microfiche for $75 a copy. There are three sets in all - by callsign, geographic area, and frequency - for a total of about 200 fiche. | His current set is from early 1993. E-mail Lee for more information. [As | of 8-Apr-94 the above e-mail address was not valid. If you know how to | contact Lee, please let me know.]

The Bearcat Radio Club sells the FCC master by state for $15. Bearcat Radio Club can be reached at P.O. Box 291918, Kettering OH, 45429.

PERCON

PerCon sells a variety of FCC data on CD-ROM and floppy. CD-ROMs are available by state, region, or category, and floppies are available by state. Also available is a CD-ROM of the entire US (2.5 million records). Data is updated approximately every six months.

State floppies are $35 per state. CD-ROMs are $100 each. Quantity discounts available. PerCon can be reached at 716-386-6015.

POLICE CALL

This is probably the most cost-effective source of public service license information. The detail is limited, but the information that is there is often more useful than the FCC master. For example, an entry in Police Call that reads, "Portland Police, Net 3, North Precinct," reads, "Portland, City of" in the master.

Police call is available in 9 volumes covering different regions of the US. It can be purchased at Radio Shack stores for $10 per volume.

SCANWARE ASSOCIATES

ScanWare Associates sells a PC-based database program called the FCC Frequency Retrieval System V2.0. It comes with FCC data for one state, covering all services from 10 kHz through 2036 MHz. Data is updated approximately every six months (last update was Dec. 1, 1993).

Cost is $35 for the first state and $20 for each additional state. (Add $5 for CA, FL, TX, NY.) Quantity discounts available. Fully working shareware copy downloadable from their BBS at 206-871-4228 (FCC200.ZIP). ScanWare Associates can be reached at 206-698-1383 (voice) or 206-698-8207 (fax).

APPENDIX

Here is table of data fields in the FCC master. Fields provided by various products are indicated by "*" or the field length, if known.

Quite close to the Vancouver International Airport.

>it scratchy.
>Any suggestions as to what an apartment dweller could put up?

I want too but we have strict by-laws on any non-plant objects in the
balcony. I think a discone with a vertical on top is the best kind.
Diamond makes a good one, plus some other brands. Radio Shack one is
not good from what I heard. Why discone? Wide band reception, vertical
polarization where most actions are in, can transmit on a few ham bands.
Then there are some other verticals for scanners which covers a few
bands, with or without active preamps. I still don't know what to buy
yet. May be someone can suggest for my case. I probably can pass with
some vertical in my balcony but definitely discone without special
approval.

>confirm this.

First, most older Uniden scanners accept frequencies at 12.5 KHZ intervals in the 800 MHz band, including the cellular frequencies that have assigned channels 30 KHz apart in North America. So you will almost always be a little "off" with one of those models (e.g. 800XLT, 200XLT, etc).

Second, there are a number of Uniden scanners that cover 800 MHz and use double conversion IF circuitry. It is common to hear strong images of 800 MHz transmissions above their assigned frequency; the distance is twice the first IF (e.g. 10.9 MHz x 2).

If your scanner's behavior is explained by one of the above, there is nothing wrong with it.

In a message on 05/01/94, DAVID K MARTIN said to ALL about Pro43 audio
mod - re*****:

DM> I tried the audio mod on my Pro-43 and didn't like it. Removing the
DM> capacitor made the audio *MUCH* better but also increased the amount
DM> of hiss that came through to unacceptable levels (for me to tolerate
DM> that is). Since I didn't have any other smt capacitors to try, I
DM> replaced the original. When I use the Pro-43 in the house, I use an
DM> amplified speaker with a tone control. In the car I usually use a
DM> small set of unamplified stereo speakers for a walkman type radio.
DM> The larger speaker produces a bit more volume than the internal
DM> speaker and the cheap construction kills most of the bass ;)

David,

Did you know that there is now a new speaker which is available for the
PRO-43? I don't have the specs here (nor have I done the mod myself) but
I'm sure someone can post the information here. Also, I have found that
a cheap mono earphone works best for me in the car. It's the same kind
that used to come with all of those portable AM radios back in the 60's.

> Key management is a big issue. If somebody loses a handheld, do
> you re-key every radio in the system? Even routine key updates are a
> headache. Does everybody have the same key, or are there communities of
> interest? The military has struggled with this problem for decades, and
> it's messy. Public-key doesn't work for broadcast systems.

I was talking to one of the local police here in Lansing, and they are apparently experimenting with the Motorola Sabre encrypted radios for tactical, HRT and so forth applications. Apparently the radios are brought into the station before every shift and are rekeyed to a common key (a procedure which takes about 5 seconds per radio -- set the key, plug each radio into the controller and press a button). Other departments in other areas may do things differently, and YMMV.

People who want to have private conversations shouldn't broadcast them over a radio. There is no way to prevent someone who is determined to monitor your cordless phone conversations from doing so. You can scramble the conversation, if you like, but that does not assure that someone will not unscramble it. Indeed, there can be no such assurance. You would stand a good chance of frustrating your neighbor's activities if you switched to a 900 MHz digital cordless phone, but you might not find one in the price range you mention, and you would certainly be frustrated, after investing $$ in a new phone, to discover that your conversations are still providing entertainment for others. If the information is confidential, don't use the cordless phone.

3297. To all scanner users

Newsgroup: rec.radio.scanner

Hello.

I have two RF signal amplifiers for sale.
If you are a scanner user, a broadband signal amplifier will grea
tly enhance the enjoyment you receive from your scanner.

The amplifiers I have for sale are $30 each, shipping included w
hen you prepay with a money order.

Here are the amplifier specs:
Frequency range: 100kHz to 1.3gHz
Gain: greater than 20dB
Noise figure: less than 4dB

These are the perfect amplifiers for wideband scanning receivers.

Please let me know if you would like to buy one or
both.

Thank you.

3302. AR1500 ???

Newsgroup: rec.radio.scanner
Date: 1994-05-02 02:55:23 UTC

Message-ID: <2q1q2r$nb0@taco.cc.ncsu.edu>
Source record: 274855

Hello.
Does anyone know how good the AR1500 is ?
Does it realy has a continuos coverage from 500Hz to 1300Mhz (no gaps,
includes cellular bands) ?
What is its price range (new Vs. half / one year old) ?
and last question, what does 'signal sideband capability with BFO' means ?
Thanks

Has anyone seen or written a PC program that works like a voice activated cassette recorder? I'm interested in setting up my PC that is soundblaster equipped to monitor my scanner while I'm not around. I guess you could possibly end up with a pretty huge digital recording on your harddrive, but I'm sure 50-100mb would hold a lot of conversations especially since there would be no blank spots in it.

If no such program exists, anyone want to write one? I might take up such a task, but I'm not very familiar with soundblaster programming and it could take me a long time to write.

>

Well just remember that it is not legal to bring one back in according to the
new law that is now fully operational. I believe the unavoidable outcome
is that the prices on these ever popular scanners will rise. There was a
guy that had a few for sale recently on the net..... :-)

I recently obtained a Realistic PRO-30 portable scanner. It appears new, and I got the charger and manual with it. I was wondering if anyone could supply me with information on this model. I did not see this particular model on a recent trip to Radio Shack, and I assumed it is at least a few years old. Also, if you own(ed) one of these, are there any things to watch out for with this model. Please E-Mail replies, as I don't regularly see this group.

Thanks,

Keith

Help?!

I've recently acquired a used OKI 900 cellular phone, and have heard that it can be used to manually scan the cell phone freq. band. Naturally enough, the local cell phone co won't loan me the service manual for this item...;) I'm sure there is an archive with this info, but I've been lurking a while and haven't seen any mention of it.

Also, the previous owner had a private dialing directory, whose memory space I can't get at for my own use. Anyone have any idea how to totally reset the memory so I can use it myself?

Any help appreciated!

Greg Porter

I have heard it suggested (but I am not a lawyer) that "receiver" need not
necessarily include "transceiver". Congress could have left it at "radio" or
specified "device" or used some other term if it wished to be explicit
about including transceivers.

3316. Feasibility of AOR3000 mods -- (LONG)

Newsgroup: rec.radio.scanner
Date: 1994-05-02 17:17:44 UTC
From: terminat@toicg3.to.infn.it
Message-ID: <9405021517.AA26002@toicg3.to.infn.it>
Source record: 274865

I have been studying the structure of the aor3000 and what I see
(and networkers opinions confirm me) its flaws are. I was arguing
about the feasibility of a few mods. Did anybody ever considered
anything similar? I would like very much to share comments.

DISCLAIMER: everybody knows how much the validity of the warranty
is augmented by an user modify; that it is impossible to inadver=
tently cause even the minimal damage to the unit due to a clumsy
intervention; that the result is blindly guaranteed, isn't it?

Note: I refer to the older ar3000, not the 3000a (to which however
the most should apply). I haven't yet tried ANY of these patches;
I'm just proposing and waiting for network response.

mod#1: BFO clarifier/extra fine tuning.
- --------------------------------------
(refer to the if-demodulators board)
The fine tuning (50 hz steps) on the ar3000 is obtained by frequency
adjustment of the 3^ local osc, between 44.565 and 44.575 Mhz. The
10 khz range is covered in 200 steps; the varicap D13 is controlled
by a variable voltage derived from a D/A converter built around the
4094 shift register Ic1 and the resistor array RA1. By the way, I
noted that despite apparently the PLL is tuned in 10Khz step and the
3^ osc to cover the finer resolution, bfos and frequency display
are calibrated in a way that USB tunes 1.5 khz below, LSB 1.5khz
above and CW ~850 Hz below AM/NFM, so that the signal band centers
always the 455khz i.f. To obtain a finer manual tuning I would add a
potentiometer between +5V and the common pin of RA1 (+ a stop coil and
a condenser, eventually); the resistance value of the potentiometer
should be of the order of the highest of RA1, so that its weight is
about +-1 bit .
Nobody says that the frequency is stable enough, however. A bfo detuning
by the squelch knob has already been reported; I add that even sliding
your hand under the unit does (the 44.57 Mhz osc is on the bottom board),
and that the adjustment of L30 (top 44.575 Mhz) and VR1 (exact 10Khz
range) is quite delicate.

mod#2: if width.
- ----------------
One of the universal complaints about the aor3000 is its poor AM
selectivity. Turning to the schematic, it is apparent that it is
determined by the 455 khz +-7.5 ceramic filter CF1. It may be a
hi-fi quest, but it is too wide to be useful in say SWL. moreover,
a +-3 khz filter CF2, used for SSB/CW is already in parallel to
CF1; one of the two is diode-selected by control bits. So why not,

either:

a) unsolder the wide filter and replace it with a slightly narrower one;

b) cut a couple of tracks on the pc and patch a manual switch for 'always wide' 'always narrow' 'wide for AM/NFM, narrow for SSB/CW';

c) skip both CFs, patch in between a variable width filter, or commute a bunch of them (a very narrow one for CW/RTTY, for instance).

I've seen that even the Icom R9000 after all uses just a bunch of steered different ceramical filters, while NRD535 instead apparently has LCs.

mod#3: broad i.f output/other demodulators.
- --
I wonder if a backpanel output of one of the if's would be of any use. In case, probabily the 45.025 Mhz would be the handiest one (e.g., take it from D7-R31). I have no instruments to measure bandwidth there; I would as a rule of thumb expect it to be of the order of the Mhz, while on 455 khz on L29 it could be ~50 khz, but do not know. Potential applications I would see are:

-wider AM bandwidth. METEOSATs have 30khz (don't they?), video has ~5Mhz;

-output for hardware spectrum analyzer (I wrote my software one, and I'm no way satisfied with it);

-sinchro AM demodulation;

-stereo WFM decoding. To this extent, also a wide decoded lf output could be taken. If I understand correctly the diagram, could be around the collector of Q36 (the deemphasys network seems to be C211-R55-C84-R58). A sort of audio patch bay would have to be implemented, but control bits for each mode are present all around.

Note however that the receiver sensivity would be determined by the AGC signal, which results after the own aor3000 _AM_ demodulation (unless one patches this too).

mod#4: tuning knob.
- -------------------
I'm quite dissatisfied with the tiny clicking vfo knob of the old 3000 and would rather replace it. The electronic here is simple, it is more an issue where to find the mechanical parts. There are an Up and a Down line on J2, cpu board, that simply have to be pulsed. I found difficulties in getting the replacement knob of the 3000a, as someone else reported too. I would see two possible improvements:

-a smooth optically encoded wheel. The sense of rotation is to be understood from the phase sequence of two out-of-phase choppings.

It is exactly the principle of computer mouses. So, find a wrecked mouse and repackage it. Just one of the displacement wheels (X or Y) need to be functioning. A 5V alimentation can be taken from anywhere (say pin 5 of J1).

-a jog-shuttle tuning whell. Remember the jog shuttle search on VCRs? A mechanical commutator, coiled to the central position has to be found (cannibalize a Vcr?). It should have +-2 or 3 positions left/ right, that should correspond to increasing pulse rates onto the down/up line. Pulses can be obtained by division of a crystal (say X2, 32 Khz, on that board), such that the lowest rate is ~1hz and the highest ~10hz.

A possibility would also be to wire J1 + 5V to a backpanel connector, leaving dimensional freedom to any fuzzy interface tuning knob.
I find extremely useful the x10 button, so I would never forget it in the modified knob. I wish I had a x100 too, but for this cpu firmware provisions should be made (out of reach).
A minor addition I would consider too concerns a tuning pulse muting. The problem is that the tuning jump produces a click, which is both noisy and triggers a low squelch. Currently a cpu muting is implemented for the final audio (Q32, C176, D34, D26)(not affecting the line out), but I find its time constant slightly too long (due probabily to C176). Maybe something analogous, driven by the tuning pulse may be put around Q24.

mod#5: on preselectors and intermod.
- ------------------------------------
The known most distasteful feature of the ar3000 is the quite high presence of MW and HF intermodulation. Despite this, however, the intermod performance of the ar is good in other regions of the spectrum: e.g. I do not experience any ill effect due to broadcast FM transmitter (I stress that I use to operate my radio at some 2Km from the site of some 60 different repeaters, filling all the 88-108 range, many with powers well above 10Kw). I have the strong feeling that the intermod just depends from the way the coverage is partitioned among the 13 front end band pass filters (i.e. the FM range falls in its dedicated bandpass, while 10-30 Mhz is stuffed together). If I'm right, I cannot understand the designer's choice; perhaps a narrower partitioning scheme of the HF would have enhanced the performance there. Since changing the filters and the relative switching logic will imply to modify half of the machine, it is out of cause. Did anybody tried out an external preselector? If this is the point, would it be possible to render the preselectors TUNABLE? By the way, this is the basic design of superetherodines, and in a sophisticated way what is done i.e. in the NRD535. To tune, varicaps would be employed. As control signals, one has the PLL-Vco control voltage, plus the switching bits for 0.1-0.5, 0.5-2.5, 2.5-10, 10-30, 30-50 Mhz ranges. I have not figured out which type of tunable filter would be appropriate. I just note that NRD535 simply has double tuned LC transformers, while ar3000 uses for HF an array of 7th order LCs. Intervention on the front-end board looks quite

difficult, since the pc is 4-layered. Also, the 1:5 frequency
ratio of LW and MW bands would require a 25:1 capacity ratio of varicaps,
in spite of linearity.

Just to mention it, on the front-end board there is a dedicated HF
buffer amplifier that can be inserted or bypassed (SW1&2). If you
switch it off, the sensitivity decreases to something in between att
and no att, while the intermod smearing improves sensibly (more
than with buffer and att both on). I for me however resolved to leave
the HF buffer on, preferring sensivity.

Repackaging?
- ------------
Mods like the above would result in an increased number of manual
controls, since it is not easy to have them cpu-linked
without rethinking the whole control bus of the aor and rewriting
the cpu firmware. I can't see any less indispensable function that
could be converted into a patched one. For instance, the Att command
bit could be turned to a (say) narrow Am bit, but will the change
be worth? (Maybe yes, if it looks more appealing to manually operate
the attenuator rather than the notch filter).
Though a little space for additional circuitry is present in the inside
of the Aor, it is almost impossible to find space for extra knobs on
the unit panel. What about repackaging the unit, then? Extra additions
I thought useful or saw the desire for in previous postings are:

-a rugged solid case (maybe a metal box would reduce RFI birdies, too)
-a better loudspeaker/ a more powerful audio/ tone controls
-a large, smooth, weighted tuning knob
-a lit keyboard (lighting controlled by the LAMP function)
-a self contained rechargeable battery pack
-a 'SEND' switch, like on the 3000a

Of course all of these would turn the aor more into a tabletop rec,
but after all has it ever been a handheld?

Sought mod:
- -----------
Anybody has any ideas on how to implement an AFC control
that centers signals when scanning in FM, as I read about the ICOM
R7100? What about summing an AFC voltage derived from the N or WFM
decoders to the squelch level, so that the scan stops only when the
the signal is high and centered enough?
.....
All the above is just my own view. Waiting for your feedback,

Enrico Segre

Cross-posted to: rec.radio.scanner,alt.radio.scanner

Did anyone who went to the Hamvention check out the Optolectronics counter? I chatted with one of the engineers who designed the new 456 board for the PRO2005/6. Evidently this new board is 'superior' than the HB232, as its firmware coexists with the new 2006 (firmware cell lockout). When the new '456' board is implanted into the 2006, the board takes control of the RF sections, and effectively shuts down the GRE firmware. The result is, any frequency lockout mandatory implanted by GRE, is disabled. The 456 board ALLOWS the new 2006s to tune what the old 'diode-clipped' 2006s can. (No 512-760 Mhz still)

The board requires a PC to be connected to it for control. When the 2006 is under '456 control' the LCD becomes blank, and the board/PC assumes total control. When the computer is not needed/available, the 2006 will act as if nothing happened to it. No soldering is required, although one test point should be soldered.

It currently doesn't work for the 2004. I'll post more info when I have more time, gotta get to work!

I am looking for a BBS in the Detroit area that has frequency lists for the Detroit Area. An ftp site that has Detroit frequencies would also be good. Are there any organized scanning groups in the Detroit area ? The Detroit area to include Port Huron, Pontiac, Ann Arbor, Monroe and everything in between.

Thanks in advance
Dennis

3320. Yupi 7100 specification

Newsgroup: rec.radio.scanner

3322. AOR1500 help?

Newsgroup: rec.radio.scanner
Date: 1994-05-02 20:29:37 UTC
From: nabarlek@yiffy.tigerden.com
Message-ID: <2q3nrh$1uk@ns.oar.net>
Source record: 274872

I purchased 2 AOR 1500 scanners at the Dayton hamfest this weeked and we seem to have done something bad to it while trying it out - no thanks to the almost useless manual that came with it.

At the moment one of the units is in a state of almost total nonfunction. It kinda looks like it has forgotten its programming or something.

so.. can anyone offer any advice on how we might reset this unit, or otherwise restore it to a functioning state.

Thanks.

Darren Holland.

Does anyone have the mod to restore the 800 Mhz band on the Pro-37?
Any help would be appreciated. Thanks in advance.

3327. More BC2500XLT mods?

Newsgroup: rec.radio.scanner
Date: 1994-05-02 21:19:35 UTC
From: vanderby@mprgate.mpr.ca
Message-ID: <1994May2.211935.6780@mprgate.mpr.ca>
Source record: 274775

To enable cellular coverage on the BC2500XLT you move
a single resistor. There are 4 other resistors that can
also be moved to change logic levels going to the CPU.
Does anybody know what the other 4 resitors enable/disable?

Also, looking at the schematic, the unit uses an 8K EEPROM
and 2K of RAM. So why does this unit drain the batteries
when it's off (to keep the RAM alive). Why don't they
store the data in the EEPROM so the batteries don't drain
in 4 days when it's off?

3328. New scanner, AOR-8000?

Newsgroup: rec.radio.scanner
Date: 1994-05-02 21:22:01 UTC
From: warburtn@teaching.physics.ox.ac.uk
Message-ID: <1994May2.212748.19062@inca.comlab.ox.ac.uk>
Source record: 274871

I was reading today in a magazine ("Short Wave", I think. A UK magazine).
That AOR are just about ready to release a new hand-held scanner. It should
have been out by now, but they claim to be having some problems with the
micro-controllers. Apparently there is a world shortage of this particular
MPU, which is used in cellular telephones. I don't quite believe that
story about chip shortages.

Anyway, has anyone else heard anymore about this new hand-held? I believe
it was the AOR-8000, but I could be mis-remembering. It must be out to
try and compete with the Yaesu MVT-7100; so hopefully has AM/SSB/NFM/WFM
etc.

From Richard Warburton.

3331. Yupi MVT-7100 initial opinions

Newsgroup: rec.radio.scanner
Date: 1994-05-02 21:51:33 UTC
From: horak@convex.com
Message-ID: <horak.767915493@convex.com>
Source record: 274874

First, some background on a few of my other toys so you can be aware of any bias I may have. I own a Pro34, Pro2006, DX-440 and an Alinco DJ560. I am generally pleased with the Yupi. Here are my observations after playing with it for a week.

The scan rate isn't bad at 30 channels per second but it should be faster. Scanners costing less than half as much scan 30 cps. There were lots of accessories with the radio. I like the 12v car adapter and the fact that the radio uses 12v in. The supplied swivel telescoping antenna is a refreshing change from the stock crap that comes with most radios these days (ie. rubber duck). Sensitivity is good on all frequencies I have checked and there seems to be minimal intermod and very little overload. AM radio frequencies on the medium wave 530-1610 band come in good for a radio that has no internal coil; better than I expected. Shortwave freqs come in as good as my DX-440 and I am impressed with the SSB functionality. I've heard people complain about selectivity but I can live with it. I can see where a narrower filter would be a plus. The 50 hz increments are nice in SSB mode. 45-50 MHz comes in better than my Pro34 or Pro2006. The biggest bummer so far is trying to scan the 800MHz trunked freqs since the Yupi has an automatic 2 second delay. With all the programmable stuff on this radio, why didn't they allow selection of the delay time? You have to choose 2 or 4 second delay. The battery save function; for example, allows three different selectable save modes or completely off. The strange thing is that if you go into scan or search mode, the back into manual, the battery save function is permanently off unless you program it back on again. Kind of stupid. If I want it in the save mode, scan for a few seconds and then go back into manual mode on one frequency, why should the battery save go off? Since I mentioned the scan mode, let me mention a similar quirk. If you are scanning a particular bank and hear something you want to stop on, then later decide to resume scanning, just hitting the scan button starts scanning ALL 10 banks. It seems to me that if I was, for example, listening to banks 3 and 4, that I would want to resume the same scan. But, to do it, I have to enter 3-4-SCAN to resume scanning those banks. That can be a hassle while driving, especially at night. The idea of putting the SCAN/MAN buttons on the top of the Pro34 was a great idea and the way the Pro scanners bank scan is better. I like having 1000 channels but only 10 banks is a drawback. I doubt if I'll ever use the mode scan but the PGM scan is a nice feature. The frequency pass is great for birdies and pager freqs and the SPR button allows you to look at the frequencies you have eliminated. I wish there was a similar way to review the memory channels I have passed; something similar to the Pro2006's lock-out review. The programmable attenuator is a great idea

and so is being able to turn the keyboard beep off. The lighted keyboard along with the LCD is very handy at night. The LCD is not easily read at even eye level or from above. It is fine from below. The VFO is nice whereas the Pro scanners have to program a memory to tune a frequency. Also, when programming the Yupi memories, the fact that the memory locations automatically advance for you is nice.

There are several other minor things but these are the observations that stand out in my mind. Again, the 2 second delay really sucks. An otherwise fantastic radio in most respects, this delay *feature* really puts a damper on things. If you ever scan trunked stuff, you'll understand what I am talking about. I have compared the Yupi side by side with my Pro34 on 800MHz trunking just to see what I am missing during those two seconds and it's downright depressing! If anyone knows of a way to defeat this delay, PLEASE let me know.

All in all, I'm happy. Lots of good things in a small package!

David N5OFQ

IJ>want this person to know what is going on... Most of the time, tactical
IJ>units don't use radios because of this problem, but this puts restraints
IJ>on their work...

I'll tell you another reason...Here in LA, all the news agencies listen
in, and they cause a couple of problems:

1) I have seen on-going Tactical operations on LIVE TV. In some hostage
situations, all a crook has to do is turn a a TV set to get the up to
the minute news, thanks to the news media (Alerted via scanner
transmission).

2) I have seen numerous TV news vans converge on HOT calls before units
get to the location. Not that we'd try to hide anything, but they can
and do get in the way.

3) During a recent Pursuit...the overzealous News vans tried to overtake
the lead Police Units. The CHP had to be called in to stop and ticket
them. Anyways...where do you suppose the News media picked up all the
info to begin with????

Can't speak for the US, of course, but use of scanners by criminals is
pretty common over hear and enough of a problem that most Police
Forces either already use encrypted radio signals or are actively
researching it. Scanners are used here by anyone from car thieves
& burglars at one end of the spectrum to drug dealers and
terrorists at the other.

Regards,
Oliver.

I found myself using the MODE scan for aircraft stuff. I didn't fill
and entire bank with my AM aircraft freqs, and found that the MODE scan
allowed me to scan only them thereby separating the FM from AM freqs
in the bank.

>for birdies and pager freqs and the SPR button allows you to look at

Has anyone noticed birdies on theirs? I haven't really looked by
doing the familiar "remove the antenna and search" trick, so I
was wondering if anyone else has.

I have no solution for how to defeat the 2sec pause, but do have a
suggestion for a workaround that seems to work OK for me. I just
hold the radio while scanning and hit the up arrow with my thumb
when I want the scan to start again. Alternatively grasping the
tuning know to be ready for a quick twirl will do the same thing.

It a little inconvenient to use thsi way, but it will do better than
waiting for the timer to expire......

I have about 5 handhelds that I use at home and I'm trying to find
an easy way to keep track of them. I noticed an ad from R.S.B.
in Monitoring Times which seems to address my need. Has anyone purchased
one of their handheld stands? Any other suggestions? I'm looking for
something to buy not make, I'm LAZY....

Thanks in advance,
David

Along the same line, does anyone know if any of these companies perform
the Memory expansion/light mod that was posted sometime back? I
understand the directions, but don't have the soldering finess. If
it's cheaper, I could even by the parts n' everything and mail it to them
with the directions. I guess in the end, the companies reputation comes
into play because I sure as hell will not send my Pro 43 to some idiot
who's used to removing that tiny little diode with an exacto knife for $40.

Also, how long does the process take? Do they provide rentals?
I don't think to many of us could live too long without our scanners.....
I suffer enough from the only "if I had my 43 with me" syndrome now.

Any comments or experiences would be great.

Please post as I'm sure I'm not the only one......A new Faq ??

I am personally aquainted with CELLULAR SECURITY GROUP. I can attest that anyone wishing to send a radio for cellular restoration need not worry. The owner and technician is an Extra class amateur with many years of experience. His work bench is clean and well-equiped and he takes great care to do neat and professional work. They did the modification on my Yaesu FT 530 and I am very pleased with them. I live quite close to their facility and have visited it several times. They have a very fast turn-around. I recommend their services without hesitation!

I have used those adjustable plastic display stands from Radio Shack, the ones also used for calculators. Some stores will sell them to you and some won't.

>seem right? If so, how was it calculated? The add for the ASTRO says
>the radios have an encryption algorithm capacity of 2 algorithms per
>radio and 16 encryption keys per radio. What is this telling me?

I can't find the info on the Astro product line here in my office, but here are the basics as I remember.

The ASTRO is a digital radio that runs a version of TDMA (I think). Being digital, the conversations are already "encrypted" to some extent, similar to the new digital cellular. SECURNET is Motorola's encryption scheme that conforms to DES standards. So, the already digital stream from the ASTRO radio is run through the DES encryption algorithm.

As far as the 16 encryption key capacity of the radios, this feature would allow you to have a different encryption key for each channel in the radio. Thus, even if someone could crack ONE of the channels, the other 15 would still be encrypted.

The first ASTRO radios I played with still had wire wrap jumpers and a noticable delay (almost 1/2 second) on the voice transmission. Now that everything is on the circuit board, the delay is much less noticable and the audio quality is pretty darn good. There is a little degredation running through the SECURENET. However, the analog radios running the SECURENET had similar degredation.

From: phybs@mizzou1.missouri.edu
Message-ID: <phybs.101.000FE941@mizzou1.missouri.edu>
Source record: 274819

I remember reading a thread some time back about propagation of signals ca. 30Mhz on up. I have a BC700 with preprogrammed utility freqs and Sat night I was picking up police in 30-40mhz that were from the eastern time zone and speaking with PA accent. Then police (?) from South America. As I tuned further, I picked up something at 30.79. Some guy kept calling out names and addresses in a hurry in Italian, later in Spanish, then Italian again (yes I can tell the difference). That went on from early evening through the whole night.

Can someone remind me how this is happening.

Apparently this is very common with this model. I have one and it does
it too. A work around is to use a 12v DC adapter and use it for its
power source. The humming will stop then. Kind of strange but I live
with it.

> Paradise has crypto gear? Their department must have too much money.

<stuff about over-important small towns encrypting deleted>

Interesting problem. Cops, IMHO, shouldn't be saying anything on the radio that they wouldn't say in public. The only possible exception that I can think of would be tactical ops. Of course, if you're going to go to all the trouble of encrypting the SWAT boys, then why not do the whole department?

I thought about this in terms of the "post card" argument (Why don't you put all your mail on post cards? You use *envelopes*? What are you hiding?). Certainly that applies to private citizens, but I'm not sure how it applies to a public agency doing the public's work in a public radio spectrum.

We're lucky around here, only the Rogers (Ark) PD uses DVP. The UAPD used to use inversion, but they've stopped. Even the small towns that answer the phone by radio don't bother to encrypt.

> upgrade from my Pro-43 yet.

The PRO-51 is not an upgrade from or a replacement for the PRO-43. So far, Radio Shack has not released a direct replacement for the PRO-43, which would have to include coverage between 220 and 400 MHz.

Ditto. I have the same problem with mine. Scared me at first but it
does not seem to affect the performance at all.

In <1MAY199413125468@alpha.sunquest.com> krl@alpha.sunquest.com (ken r. lauver) writes:

>My friend really wants to get the freq for channel 18. He said he
>heard them say to switch to channel 18 at the El Torro (sp?) show
>and could not catch them after that. He said they switched to it
>after discussing a radio problem they were having.

>If anyone knows it and can send to krl@alpha.sunquest.com my friend
>would be very appreciative.

According to the 8th edition "Registry of US Govt. Freqs" by Tom Kneitel,

The Blue Angels are.....
121.9, 123.4, 134.1, 141.56, 142, 142.025/142.65, 143, 143.6, 241.4, 250.8,
251.6, 275.35, 307.7, 360.4, 384.4, 391.9, 395.9.

The Thunderbirds are.....
66.9, 114.95, 120.45, 123.4, 124.935, 140, 140.4, 141.85, 235.25, 236.55,
236.6, 250.85, 273.5, 283.5, 295.7, 322, 322.6, 382.9, 394.
Thunderbird ground crew....
413.025, 413.075, 413.1, 413.15, 413.275, 413.35, 413.4.

Most air comms should be AM while ground crews are most likely FM.
Although no ground crew was listed for the Blue Angels, check out the
140 MHz stuff for that. Also, the 142.025/142.65 is likely a repeater
output/input.

>!
I find that a good ground (or pseudo ground...) helps a lot. In any case,
a long wire or significantly loaded shorter antenna will help. The mvt-7100
doesn't have a tremendous amount of dynamic range (RF dynamic range) below
5 or so MHz, such that with a good antenna and ground I often get strange
beeping sounds and other stuff from utility SW bands in the AM broadcast
band.

The pseduo ground I mentioned occurs simply by using a transformer coupled
power supply. I can pick up 780KHz from Chicago here in Kansas City on
good days & nights with a power supply, not without.

In any case, the coolest receiver I've ever seen.

I've had a Pro2006 for a few years and have bought a Yupi '7100.
I agree that it's a great set but the feature that a miss the
most is the 'Sound Squelch'. There are loads of blank carriers
around here in England which only contain speech now and again.
The Yupi stops on EVERY ONE, whereas the Pro2006 just sails past!

I am. Protecting the public involves efforts to protect the integrity
of sensitive law enforcement operations as well as restricted info
(criminal histories) or information generally deemed to be private.

>We're lucky around here, only the Rogers (Ark) PD uses DVP. The UAPD used

And what makes the ECPA and Scanner Ban laws all so much more
stupid is the fact that Sec. 605 of the Communications Act of 1934
already prohibited the divulgence of any communication save for those
of amateurs, broadcasts and ships (and planes) in distress. There was NO
need for a new law(s).

Get hold of your congresscritter and invite him to get involved
with the repeat of BOTH the ECPA and the Scanner Ban laws. If he won't,
vote against him and urge everyone else in your district to do so as well!

From: veith@cherokee.nsuok.edu
Message-ID: <1994May3.234651.11457@cherokee.nsuok.edu>
Source record: 274824

My new Radio Shack sales flyer lists the Pro46 handheld scanner on sale for $189.95, down from $229.95.

Any comments on the quality of this scanner? Is there an easy restoration of cellular freq's? I checked out ftp at oak.oakland.edu and didn't see anything. They did have a number of mods for the 2006 which I just bought (luv it!).

>trunked system? Sometime ago, I saw an article describing trunked systems,
>but I don't think I saved it - anyone have a copy to email me?

Its not to hard. But it does hog an entire bank per police department.
Just enter all the trunked frequencies into the bank with no delays.
Set to scan just that bank. As soon as they dekey/rekey you'll zip
right to the active channel.

If its a large city that is very active with many dispatchers, it will
be more difficult. You'll just have to hit the scan key often in order
to catch a particular conversation. If there is only one dispatcher its
a piece of cake.

dh> This radio is brand new to the current (1994) catalog. Anybody know
dh> why Radio Shack is giving up on it so soon?

Dan...

It is a unit manufactured by Uniden. Uniden is discontinuing the
manufacture of units capable of modification to receive cellular, per
federal law. Probably won't have enough on hand for the 1995 catalog.

Speculating...

Jerry

If you enjoy scanning buy both (if you can). You will love the 2006 in
the city, as it has much less intermod than the 43. The tone is great and
if you ever decide the 2006 can be run from a PC. The down side is that
you can't take it with you (very easily) so you really need a HH for the road.
Good luck.

I would suggest the following:

The Lanz Company
3523 Dayton Avenue
Louisville, KY 40207

I use one for my handheld and I find it very stable.

All,

The moderator that night (we call it Net Control) is AA5QX, Jim Lawyer. Jim has got to be one of the best there is. That night was extremely nasty. I was spotting north of the Lancaster area (Farmers Branch to be specific) and I had friends south of there in Ellis County. It was not fun spotting at night.

With regards to the news delay, my parents and sister learned about the delay in the Wylie-Mother's Day tornado. The TV stations a catching up, though. Ron Jackson, N5OJT, is a local weatherman and makes frequent appearances on our RACES nets during bad weather.

Be careful out there!

The big problem (from the FCC point of view) is that is can't be made
with celular locked out, it picks up cell intermod out of the box. There
is a cell mod available for the radio, it get posted here from time to time.

restoration is relatively hard. surface mount diodes.
Since its not triple heterodyne, it really picks up alot of stuff
on other frequencies. A pro 43 is easily worth twice the price.

Listening In to Air-Ground Phone Communications
****

Some people in our hobby find that listening to 800 mhz cellular communications is interesting. Those who do, might find that some real inside, juicy stuff could be found being broadcast from the private jets carrying entertainment industry executives, business leaders, and goverment officials across this great land of ours.

The frequency assignments are as follows:
Chanl Ground Plane
1 454.950 459.950
2 454.900 459.900
3 454.850 459.850
4 454.800 459.800
5 454.750 459.750
6 454.700 459.700
7 454.725 459.725
8 454.775 459.775
9 454.825 459.825
10 454.875 459.875
11 454.925 459.925
12 454.975 459.975
CALL 454.675 459.675

The Ground stations broadcast an annoying tone when not in use. The Planes broadcast in simplex only, while the Ground station broadcast duplex similar to cordless phone base/handset operation. The easiest way to monitor this service is to load first a Plane frequency then a Ground frequency for each channel. After loading all the channels go back and lock out all of the Ground frequencies. Scan the Plane frequencies for simplex transmissions and when you get a hit, press your manual key to jump to the next frequency... the locked out ground frequency broadcasting in duplex! Leges.

Please keep in mind that the services provided on these frequencies are Common Carrier and perhaps subject to the same laws covering the monitoring of Cellular Phones. In which case it is a violation of federal

law to listen to these frequencies.

Prepared by EQKimball
****

Hope this helps.

For those who are interested:

Optolectronics had the introductory price for the '456 board' at $299. They had some at the show and sold out. One of the guys in Toledo got one, but had to send it back, as it didn't fit right into the 2006. BTW: It hasn't been officially released to the public by Opto, they were just showing it off for future release. If I hear anymore about it, I'll be sure to post it!

Later...

>Thanks, Franklin

This hum is caused by the step-down transformer in most cases. My 2005 hums
also. I finally started using a 12v supply left over from another scanner.
Now it is totally quiet - and there is almost no internal heat generated,
which will make the scanner last longer.

To scan a trunked system, you need all channels in the system (5 or more). Program all of these channels into your scanner and turn the delay feature off if it's not already off (for every frequency in the system). You'll hear at least one control channel, which sends data to all radios. Lock this frequency out. Most systems change data channel frequencies daily, so you'll need to unlock that frequency and lock out the other.. Just make sure you've unlocked the old frequency, as you'll eventually find most of the frequencies locked out... Also set your scan to only scan the frequencies in the trunked system (put it in a bank and scan only that bank) so you can get replies faster. That's probably the best advice I can give.. 73 de STEVE KE4GFF

They are somewhere in the upper 200MHz to lower 300MHz range. Same as many
newer garage door openers. They emit a quick burst of data. I can pick up my
door opener on my 2500xlt around 270 Mhz (in that range).

HOW TO SCAN THE 800MHz BAND ON ANY SCANNER!!!!!!!!

You can make your scanner tune the 800 mHz band by simply taking an old, but working UHF TV tuner. Attach a 9 volt dc battery to the unit, feed the output into the scanner antenna input jack and scan from about 43 mHz to 46 mHz. An antenna about 1 to 2 inches long on the 300 ohm plugs works fine locally. The tuner needs to be set on channel 83. Have fun!!! Happy scanning! Enjoy!!!

Not necessiarily. For example, one of the 2 meter repeaters around here has a 8 watt transmitter. Lots of 2-meter tranceivers output more than that. The primary ingredient is (as you mention) the altitude or more specifically the height above average terrain (HAAT). The repeaters here (space coast Florida) aren't a very high altitudes, but then neither is the ground.

The May-June Grove catalog arrived yesterday with the
following bits of information . . .

IOCM has announced they are removing the entire 800-900
MHz portion from their R7100, R100, and R1 scanners.

The popular Realistic PRO-2006 scanner has become the
cellular-unrestorable PRO-2006A, while the PRO-43 handheld
remains unchanged due to the difficulty of restoring its
cellular capability.

I've noticed birdies here and there, but I didn't keep a log. A
few of us have noticed that birdies are somewhat dependent on the
antenna you're using; you'll get them with the whip in place but
not with an Austin Condor, or vice versa.

Good listening.

If you're talking about the hand-held one, watch out -- I must have gotten a dud. It wouldn't pick up inside my house. It received interference from pagers. It never alerted at the test time. I returned it and got the table-top model ($40). This one worked much better -- good reception through the AC line, and almost as good through the rod. Gotta plug it in, though. Alert sound is good and loud and it works.

3405. SW Radio Reviews

Newsgroup: rec.radio.scanner
Date: 1994-05-04 16:03:09 UTC
From: jlloyd@pluto.cs.clemson.edu
Message-ID: <2q8gvt$3hr@hubcap.clemson.edu>
Source record: 274761
Cross-posted to: rec.radio.shortwave,rec.radio.scanner,rec.radio.info

---

Below is a collection of SW receiver reviews written by readers of Rec.radio.shortwave. The number following the brand and model number is the number of readers, who indicated they use this type of receiver.

All credit for these reviews should be given to the readers of this group and not me.

John Lloyd

Sony 2010 - 3

I found it VERY easy to plug in and start listening. The supplied instructions are adequate for what they do, but
are not really enough to really start enjoying the radio. The whip antenna works great at home, but just doesn't cut it at work (way too much metal/interference). Even the supplied wire antenna does not seem to help at work (I have not yet tried it at home (no real need).

****
Realistic DX-342 - 1

I've owned this little radio for about a year
now and am really pretty happy with it.

Advantages: Size - Measuring approximately
4 3/4 x 2 5/8 x 1, you can take this little
mini anywhere! Even slip it into your shirt
pocket!
SW bands - Covers 9 SW bands: 49m, 41m, 31m,
25m, 21m, 19m and 16m.
MW, FM, FM Stereo (thru headphones)
Travel Power lock
Push button control
Runs on two AA batteries or AC adapter
Travel pouch
Carrying strap

Disadvantages: It's an analog unit, guys and gals,
no digital display.
No back stand
Antenna does not rotate up

I've had a lot of fun with this little receiver. The
SW sensitivity is quite good for my area of the
country, Cleveland, Ohio. The speaker has a nice sound
and improves thru the earphones. FM stereo thru
headphones is great! MW DXing is surprisingly
good! I can grab signals from Boston, Chicago,
New York and Cincinnati much better than on my
Magnavox AE 3625 Digital!

Summary: A nice little travel radio that's fun
to fiddle with or take for travel when you're in
a pinch. Radio Shack has discontinued this model
so you might be able to find it on sale for around
$50.00. I love the size! Ideal for travel! I'm
beginning to think that anything larger is too
cumbersome. I do miss the Digital Display and all the
features that go with it: Freq. display, Alarms,
world time display, etc. If I were buying today, though,
I'd consider what else is out there for just a bit more
money. For example, the new Sangean 606 is only
slightly larger and has all the digital features mentioned above that I miss. I
've seen it priced for as little as
$179.95!

****
Realistic DX-375 - 1

It costs $99.99 though I got it for $89 since I had a coupon for a
rebate. For the price I think I got a good deal. It has digital tuning
and direct input of frequencies which allows tuning to be a pretty
simple job and not a time consuming act of patience. It uses two C type
batteries... I use rechargable ones and they last a pretty long time..

It is not small enough to carry in your shirt pocket but it could fit in
the front or side pocket of an average sized backpack. It is just great
when you are walking back home from school/work ... it can be easily
carried in one hand as you catch up on the news from
BBC/Deutschewelle/Radio Australia/etc.... as you walk home..
I get decent reception of all the `big stations' even indoors and have, on
occasion also been able to tune to Radio UAE....

The sleep function is perfect for someone like me who likes to fall asleep
with music... the FM sound is pretty good in stereo (headphones)... The
AM reception is also fairly good but it has a very high tendency to catch
those Bible bashing stations...probably a reflection of the region where
I live...

The strap is a little shoddy and I have a feeling I may have to `fix it'
soon... I expect it to pop out any moment....
Despite that, I like it...

****
Realistic DX-380 -2

I've owned a DX-380 for about 9 months now and....
It's a GREAT RADIO! However, I should qualify
this. I bought it on sale from Radio Shack for the
bargain price of $129.95! It regularly retails for
$179.95. At $130.00, this radio is a real steal!

About the size of a large paperback book, the 380
is feature packed!

*DUAL CLOCKS
*ALARM WITH RADIO/BUZZER
*60 MINUTE SLEEP TIMER
*DUAL BANDWIDTHS
*DIRECT FREQ. ENTRY TUNING
*TUNING KNOB
*SLEW TUNING
*TUNES IN 1 OR 5 KHZ STEPS
*CLOCK DISPLAYED SEPARATELY
*BACKSTAND
*STEREO THRU HEADPHONES
*CONTINUOUS SW COVERAGE...NO GAPS!
*AUTO SCAN UP OR DOWN
*ANTENNA ROTATES AND SWIVELS
*CARRYING CASE

The sensitivity of this radio is GREAT! With a reel antenna, it's even
better! I read another review that said reception was lousy....I think
that individual should check his particular receiver as he might have
the rare defective unit. MW reception is also outstanding and with a
Slect-A-Tenna is greatly improved! Herein Cleveland, I pick up
Chicago, Cincinnati, and Pittsburgh during the day WITHOUT the
select-a-tenna! With the S-A-T reception gets an added boost!
(these are all 50,000 watt stations)

I have found it to be about the perfect travel size. I would like
something smaller, like the 606. This size, however is fine. I've
carried hardbound books on jets that are larger. The many features
makes up for it's slightly larger size over a mini. It does not have
SSB, but I really don't miss it.

All in all, A great radio priced at $130.00! I would not have bought
it for the price of $179.95. There are other radios in that price
range that ive ya more bang for the buck. At $130.00, it's a great
deal! If you can get it at that price, snap it up!

I am by no means an expert, but I have a DX-380 and can give some
of my experiences. First of all, I would pay the extra to get the
390 to get the single side band capability. I miss it. I miss
it. Also, the sensitivity for foreign broadcasts (I'm in DC)
without an external antenna is poor. You get the BBC and some
German broadcast relays from Canada transmitters, some south
american stuff, and that's it. BUT with a 50 m Cu wire out my
2nd story window attached to the antenna with an alligator clip,

I regularly get Abu Dhabi and Australia at night.

****
Realistic DX-390 - 2

Great mid-sized digital portable. Good sensitivity and selectivity. Digital display shows time, frequency, signal strength, and memory location. Covers LW (in 9 kHz steps), MW (in 9 or 10 kHz steps) and SW continuously from 150 kHz to 30000 kHz. FM reception (88-108 MHz) with stereo through headphone jack. BFO control for SSB reception. Built-in timer/clock, 9 programmable memory locations per band, except 18 on SW. Good audio output. RF Gain and AM bandwidth controls. Keypad frequency entry. External antenna, AC-adapter inputs.

A great radio for the beginner or as an upgrade from a smaller and/or analog unit.

Purchased from Radio Shack for $219 in January, 1992.

I have a new Realistic DX-390 (alias Sangean 813??). Seems to be a great value for the price $169 US. I haven't yet heard from someone who can recommend a radio for the same price that is better, and can back it up with facts.

****
Grundig Satellit 700 - 3

Truly a world-class portable, digital receiver. Excellent sensitivity and selectivity. Digital display with two separate clock/timers, signal strength meter, band selection, frequency readout, and user-definable eight-character "name" for each memorized station. Has RDS circuitry on FM to decode the newly-phased-in system for identifying stations by call letters, format, etc. 512 memory positions, upgradable to 2048. Tunes in .1 kHz increments. Selectable wide/narrow bandwidth for AM mode reception. Tunes MW in 9 or 10 kHz steps. Keypad frequency entry. Receives USB and LSB. Synchonous detector helps pick difficult-to-receive stations out of the crowd. Selectable automatic/manual gain control. Covers LW (150-353 kHz), MW (528-1611 kHz), SW (1612-30000 kHz), and FM (87.5-108 MHz). Excellent audio output, with separate treble and bass controls. Stereo through headphones or external speakers. Line-level out (left and right), external antenna, and 12 VDC-in jacks. Local/DX switch. Built extremely rugged. Multi-national power supply included.

An outstanding performer, and worth the price to a serious SWL or DX'er who requires portability.

Purchased from Universal Radio for $479 in April, 1993.

The Following is a comparison of the SONY ICF-SW77 and the GRUNDIG SATELLIT 700:

Both of the receivers you are looking at are pretty solid. The Sony is slightly smaller and has a somewhat more "finished" feel about it. The Grundig is SOLID with a much better sound. Neither is as good a SW signal receiver as the previous Sony, the '2010 (2001). However, they both have very advanced features; multiple (and in the Grundigs case, expandable) memories with alphanumeric tags so that you have a name as well as a frequency, all sorts of memory grouping and scanning etc. The Grundig has good RDS ident. on it's FM band, but I have a feeling that this isn't used much, if at all, in the US. If you intend to buy second-hand, be very wary of the SW77 - the early version was pretty flakey. The later version is better but still not as good as the '2010.
I think that the choice comes down to "feel". They are both quite complex to use, but both work as advertised. Try 'em both as they have quite distinct operational methods. If sheer performance on SW is the main point for you, compare them with the Sony ICF2010. You'll buy it and save some loot !
For what it's worth, I tried them both and settled on the Grundig. I have my Satellit 700 in daily use and it's performed without a hitch.

My reasons for the choice were:

1. Performance. The Grudig was much better than the early SW77.
2. Sound. I happen to prefer the slightly bassy Grundig sound to the somewhat sharper Sony.
3. Power. The Grundig takes D cells and can self-charge Nicads in the set, which is how I have it set up. (The SW77 used C cells) They both run down batteries fast. The Sony worse than the Grundig due to it's smaller cells.
4. RDS. I love it and the SW77 doesn't have it.
5. Feel. I like the, I don't know, Germanic solidity and sheer heft of the Satellit. A Satellit with a full load of 4AH Nicads can tip the scales at twice the weight of a SW77. Of course, if drop one on your foot the Sony would be the better bet ! I only use the Grudig about the house. I have a '2010 for the road.

I hope this splurge hasn't clouded the issue for you.

Editor's Note:
I have one of these radios and love it! I sent the following message to someone just after I bought it.

I just recently forked out $500 and bought a Grundig Satalit 700. The sound from the radio is truely impressive! I have always wondered why broadcasters put music on shortwave, because it alway sounded like garbage. However with the 700 I can listen and enjoy the music. The 700 has Bass and Treble controls, which

improve the sound quality but the Automatic Gain Control most likely does the most toward improving the sound (I'm not an expert, so this is just a guess!). Anyway my Wife regularly listens to music coming from a 60m band radio station in Guatemala, and can enjoy the sound. However there are some bad points. It is programable, but I have not worked out how to do it yet. Well I tried once and gave up. This is not too bad though, because BBC, Deutche Welle, and about 10 others are stored in a ROM table. And these frequences actual work (i.e. they are the frequencies for North America and NOT Germany).
Also I connected a long wire antenna and found my local AM station on shortwave. I guess the front-end is not good enough to sort the signals out when coming from a large antenna. But don't worry about this either.
If you only want to listen to the biggies like BBC, Deutche Welle, you won't need an external antenna. I am planning to put a Pre-selector between The Radio and the Antenna, and I think this will cure the problem of AM stations on shortwave and cut out some interference. Finally I recommend this radio to you. I'm sure you will have hours if enjoyment from it.

****
Grundig Satellit 500 - 2

Formerly Grundig's flagship portable SW receiver, this is still an excellent piece of equipment. Excellent sensitivity and selectivity. Digital display with two separate clocks (only one displayed at a time), signal strength meter, frequency readout, and four-character user-definable "name" for each memorized station. 42 memory positions. Tunes to .1 kHz increments. Selectable wide/narrow bandwidth for AM mode reception. Tunes MW in 9 or 10 kHz steps. Keypad frequency entry. In addition to AM, has three receiving "modes" for LW, MW, and SW: USB, LSB, and "Sync," which should more accurately be described as "fine tuning," as this implementation of synchronous detection operates differently from the Satellit 700 or Sony 2010. Selectable automatic/manual gain control. Covers LW (150-353 kHz), MW (528-1611 kHz), SW (1612-30000 kHz), and FM (87.5-108 MHz).
Excellent audio output, with separate treble and bass controls. Stereo through headphones. Line-level out (mono), external antenna, and 12 VDC-in jacks. Local/DX switch.
Built extremely rugged. Power supply included.

An all-around great performer. Now that it's discontinued, many outlets are selling this unit at close-out prices, making this radio an excellent value for the money.

Purchased from Universal Radio for $379 in December, 1992.

I have a Grundig Satellit 500 and am basically satisfied with it. I miss the 512 memories of 700 and 'SSB clarify' control sometimes.

Yes, its 'sync' is exactly fine tuning in 100 Hz steps. However, it is rather simple to make it work similarly to '700 and '2010, because the detector chip is the same in all three. Only a switch with two pairs of contacts is needed. Another design fault, the excessive distortion in SSB mode, can be partly cured by adding two resistors. For serious DX-ers it may be important that the internal ferrite rod cannot be disabled on MW and LW in both 500 and 700, so the in-house noise may become a problem on these bands.

****
Lowe HF-150 - 1

The Lowe HF-150 (sold by Universal and EEB) is a nice compromise. Similar number of cubic inches as the Sony (different shape), but offering some features of the R8. Also the Lowe is made with a mostly solid alumnum case, which is better than the Sony or the Drake. The Lowe has dual antenna inputs (wire or SO-239), record out, audio out, 12vDC in. It can run off any 12V DC battery. I use 7 aH gelcells which I recharge. The Lowe also takes 8 internal AA nicads *OR* disposable batteries. It will recharge the nicads with a builtin recharger if you plug it into an external power supply. It's a nice semi-portable radio. It has a few ideosyncracies, but you might want to look at it.

****
Lowe HF-225 - 2

I've had an HF-225 for a few years now, and I'm pretty happy with it. I use it mainly for broadcast listening. It's connected to 25m of random wire via a 5m coax run inside the house.

I tried using an ATU to improve the matching between the aerial and the coax, and on some frequencies it gave a (small) improvement in signal strength, but it was such a pain to keep retuning that I gave up using it.

I recently bought a "magnetic longwire balun", and this seems to offer the best of both worlds - improved matching between the wire and the coax, but no retuning necessary. It's rather expensive, though, and it may be that I'd have been just as well off with a home brew transformer on a ferrite ring...

The other potential advantage of an ATU, filtering out of strong signals well away from where you're listening, seems to be completely irrelevant on the HF-225. I've never yet found a case where switching in the attenuator did anything beneficial. The receiver's front end seems to be excellent in this respect.

I've got the sychronous detector option, and I wouldn't be without it. It quite often makes a heavily fading signal quite pleasant to listen to. Pity it doesn't have a selectable sideband option, though - I quite often find myself tuning an AM signal in the LSB or USB modes to try to get rid of an adjacent interfering signal.

Would I buy it again? Yes, unless I decided that I really wanted a receiver which offered a computer interface.

****
Sony SW-1 - 2

I bought an SW1E over a year ago, for listening to broadcast SW and FM at home and while travelling. I like this very small radio a lot. It is maybe expensive for a portable, but the build quality is very good, - everything looks and feels right. Battery life is good, and the set DOES work with NiCads (2*AA) contrary to the instructions. Reception of broadcast SW is good, either with the whip or clothes-line antenna. I've never noticed any big problems from adjacent channels either. As a bonus, FM stereo reception is good through headphones. Audio quality from the in-built speaker is fair, but you'll want to use phones for noisy environments. The only bug with this radio is the memory capacity - only 10 mems is really not enough to cover ALL of AM and FM.
Summary - if you want a very small portable, and appreciate high quality (and can afford it), I would recommend the SW1E. Note the E, which denotes the SW1 kit without the active antenna and brief case - these add a lot to the price, and I don't rate the antenna too highly either.

****
Sony SW-15 - 1

I bought one of these puppies on impulse the other day (at my age you should give in to the occasional impulse, just so they keep coming). Cost $85; you could probably do better by shopping the discounters.

Specs:

Dual Conversion Receiver, 6 1/2 x 4 x 1 1/2 inches, 3 AA or 4.5v DC.

Nine Bands:

FM: 76-108 Mhz, 10.7 Mhz IF.

SW: 5.775 -6.425; 6.875-7.525; 9.375-10.025; 11.6.5-12.265; 15.00-15.65
17.50-18.15; 21.325-21.975. 1st IF 10.7 Mhz; 2nd IF 455 Khz.

MW: 530 - 1710 Khz; 455 Khz IF.

Analog Tuning dial, volume control, music/news tone switch, 7 position SW band selector. FM/MW/SW select buttons double as "on" switches. "Off" button. "Hold" button to disable "on" (prevents accidental

turnons) Slide rule, multicolumn frequency display. Hand strap, foldout stand to hold at angle on table, soft carrying case. Basic shortwave guide. Telescoping antenna. FM/MW/SW "on" and tuning LEDs. Mono earphone jack.

Subjective Review:

I'm pretty impressed. Sensitivity is up there with the Pomtrex [:-)] without the "splatter" of strong stations. Analog tuning dial requires a delicate touch but for me that's part of the fun. Drift seems nonexistent; you get a station and it keeps it without a lot of vernier twiddling. MW performance was surprisingly good, as was FM. I'd recommend it as a starter radio.

****
Sony ICF-5100 - 1

I bought this radio in Kuala Lumpur in 1988, and I'm not sure if it goes by the same model number in other parts of the world. It is a shirt pocket analog tuned radio with coverage from 6MZ to about 21MZ in seven bands. The radio is very rugged and has served me well despite of the physical abuse it has gone through. Because of its small size the speaker is only small and the sound from it it a little tinny, but I used it mainly to receive news in countries without English language news services and in remote areas while camping etc. I recommend this radio to anyone, who considers size the most important factor. Cost was about US$70.

****
Sony ICF-7601 - 2

In some respects this is my favorite radio. No bells no whistles no FM stereo -- just a good solid (feels like a small brick) analogue unit. It covers AM, FM and has 10 SW bands that cover most of the "out of band" frequencies. Band switching on SW is done by a slide on the front of the radio while buttons are used to switch from AM to FM to SW. The dial is accurate to 5 kHz so is very easy to locate a station. I believe that it was simply the best low cost analogue rig out there. It's still around and can be had for well under $100.00. Grab it!!

I have a 7601 also. Most of its weight is from the batteries and the speaker, giving it better tone and volume than smaller, lighter sets.

As with other cheap analog sets, it wasn't very hot out of the box.

If you "super tweek" the 7601, it's pretty good on AM, but no match for a 2010 or Superradio III. Most of the shortwave bands peaked up well, but I never could get 19 meters working right. As with most analog portables, the whip is part of the RF tuned circuit, so one must be careful to duplicate the exact listening

conditions when tweeking the radio. Even the presence of
headphones will shift the antenna tuning.

Unfortunately the 7601 picks up FM stations at various places on
the shortwave bands. If you're far enough away from FM and TV
stations you might have room for an R-390.

When going on trips I usually take my SW-1 because of the
convenience of the presets and the reception flexibility provided
by the active antenna that comes with it.

****
Sony ICF-SW33 - 1

I've owned this radio (SW33) for about 9 months and use it as my
"carrying around the house rig." It was purchased to replace a
Sony 7601 that now resides on my desk at college (things
electronic can grow legs on a college campus). By far the best
features of this unit are its convenient size and excellent
performance on all bands, AM, SW and FM stereo. Don't get me
wrong -- this is not a DX machine on SW but for listening to the
major broadcasters, it's excellent.

The single filter selection seems just about right and tuning on SW
is in 1 kHz intervals. This at least gives you a "fighting chance" to
move away from interference. That's a major improvement over the
5 kHz that many radios in this price range allow. In addition, the
dual conversion design on SW keeps image interference at bay - a
major plus for a small portable.

The radio does not have a keypad so entering frequencies is a bit
clumsy. However, by entering the middle frequency of each of the
major SW bands in the 7 memories (5 memories plus 2 timer
memories) and slewing up or down from those positions you can
get around reasonability fast. The SW bands are changed by a
combination of 2 keystrokes.

The sleep control (shuts the radio off after 1 hour) can let you be
lulled to sleep and the timer alarm can make sure that you get to
work on time (radio shuts down after 2 hours if it is turned on by the
timer). Setting the radio alarm is very easy - once you have set the
clock, but that frankly, is a pain. The clock function, which works
very well (combination world/home time), takes at least 7 distinct
steps to set it. Fortunately the clock is fairly accurate (looses about
0.2 sec/day) so you don't have to reset it very often. The lighted
dial (stays on for 20 sec at the touch of a button) is a nice touch.

Battery life is excellent contrary to the 1994 Passport to World
Band Radio (see below). The radio has a battery "gauge" that is
activated at the touch of a button radio and shows in the display
as a battery icon with 3, 2, 1 or 0 dots inside of the battery outline.
It disappears after about 5 seconds. As soon as the number of
dots reaches 0, the radio shuts off immediately. I ran a a series of

tests with Radio Shacks Super Alkaline batteries and got the
following results: 3 dots showed for 37 hours, then 2 dots showed
for an additional 11 hours, and finally 1 dot showed for 3.0 hours
for a total of 51 hours. (Radio ran 1.5 to 2.5 hours/day with the
volume control set at 1/2 volume most of the time). At $2.89 (plus
5% for tax) for a package of four AA batteries (the radio takes 3),
that figures out to 4.5 cents/hour which is excellent. This figure differs
greatly from that given in the 1994 Passport (25-30 cents/hour). I have
no explaination for the difference but I stand by my test values.

Would I recommend this radio to anyone? If you do a lot of band-
scanning, forget it; it will drive you crazy. But at about $140.00 plus
shipping (NYC mail-order) it's an excellent "second" radio to carry
around for listening to the major broadcasters. I like it!

****
Realistic DX-440 - 2

I have a DX-440 and I think it is a good 'dabble' radio but if I
ever get serious I will look for a > $500 table model.

I love this radio! It's my main radio and I use it
exclusively at home, moving it from room to room. It really is
too large for travel

I've found the sensitivity to be tremendous on SW, MW
and FM! Very rarely do I need to attach a clothsline
antenna! It has continuous SW coverage, a great sounding
speaker, BASS and Treble controls, two bandwidths, great
sensitivity, good spurious signal rejection...It has
all the features I wanted in a starter radio! I bought
it about three years ago on sale for $150.00! I still
don't know why Radio Shack discontinued it. If you're
looking for a good starter shortwave radio and can still
find one laying about at a Radio Shack store priced to move,
GRAB IT!

****
DAK DMR-3000 - 1

I bought this radio since they have a 30-day money back guarantee
and I did not know if I would like the hobby or the radio. Good
points: direct-entry tuning, 36 station memories, fairly small so
it is easy to travel with, speaker sound was good, reception was
okay, but improved dramatically with the addition of the Radio
Shack 23' rollup longwire ($8.95). Bad points: only 5kHz tuning
steps, only major broadcast bands tunable (large gaps between
bands), selectivity not so good, no fine tuning, no BFO, no SSB
or CW, poor FM reception. All in all, not a bad radio of $69.90,
however, it left me wanting for more, so I got rid of it.

I have seen a couple of posts asking for a low cost SW receivers.
I have recently bought a DAK Model DMR-3000, for just

$69.90+$6.00 shipping from DAK - a mail order company.
The receiver has a direct access, so you can type in the desired frequency, and a manual / automatic scanning system. It also has a dual time clock with alarm and 'sleep' timer. Unfortunately you can tune only to the commercial frequencies on SW, AM and FM bands. I have to say though that cheapness comes at a price. The first receiver I got was defective so I had to ship it back and ask for a replacement. Now, I received a new one which works very well.

Compared to my Sony ICF-7601 the DAK unit is an insensitive brick. The fancy clock and timer features aren't really worth it. About the only thing nice is the FM Stereo support if you plug in headphones but the FM sensitivity leaves much to be desired as well.
Something else to watch for.... That pretty lettering on the buttons will wear off REAL fast. If you haven't used it much yet you won't see a wear off REAL fast. If you haven't used it much yet you won't see a problem. After you've done some tuning you'll see the pretty arrows disappear from the buttons.

****
Sangean ATS-803A - 1

Since I was now turned on by SWL'ing, I moved up to what most people agree is the best all-around radio for this price. Good points: excellent frequency band coverage (150kHz to 30mHz), fine tuning, good selectivity, BFO for SSB and CW, many scanning options, lots of accessories included, good AM and FM reception. Bad points: way too big to travel with, high battery consumption, synthesizer noise in background all the time, scanning frequently skipped lots of "listenable" stations that I was able to get by manual tuning (what's the use in scanning, then?). I found that adding a longwire antenna only increased interference and noise while not improving the set's scanning sensitivity. Overall, a fairly good radio for the price...

I have a Sangean ATS803A which I love. Comments to quote me on would be that it's an excellent beginner's radio for the price. Although I've heard that the 818 is the "latest and greatest" in this price/performance category. I especially love the full coverage 150kc-30mhz and the (albeit lo tech bfo) SSB capability.

****
Sony ICF-SW20 - 1

I was in dispair when I could not find a decent travel portable for under $200. However, I accidentally crossed paths with a Sony ICF-SW20 on sale (normally $99, on sale for $49.99) at a local store and had to check it out. It is an analogue set, but since I got a 30-day return policy on it, what the heck? Good

points: analogue tuning so no problem with confining 5kHz tuning steps, INCREDIBLE SENSITIVITY - this radio blew the DAK and Sangean away with the number of stations I picked up, good selectivity (no fine tuning knob - all you need to do is turn the tuning knob slowly), tiny size (4"w x 3"t x 1"d), small whip antenna (only 18"), addition of Radio Shack rollup longwire increased sensitivity even more, great low price (if I lose it or its gets destroyed, no problem replacing it), tuning bands are wider than the major broadcast bands, so you do get some utilitiy reception as well as WWV, AM and FM are really sensitive while FM goes from 76mHz to 108mHz so I can pick up some TV as well. Bad points: frequencies cover only seven broadcast bands (I can live with that, though), only monaural earphone included (however, you can get a $1.39 mono to stereo headphone plug), no BFO for SSB or CW, no station memories. All in all, this radio gave me the best price/features/size ratio of the ones I checked out first-hand. It's a keeper for me!

****
Magnavox 3625 - 1

Finally received my Magnavox 3625! Well, I'm certainly happy I purchased this little radio. Sure, it's not top shelf, but it's suitable for travel purposes and gives adequate SW coverage.

Has these features:
Travel Lock
Alarm (beeps, does not turn on radio)
Sleep Timer
9/10 KHz switch - for world travel
12 hour clock (however, when unit is swith to 9 KHz steps 24 hour clock kicks in)
20 presets - 5 for each band FM, AM, SW1, SW2
Dual time
Auto store - this feature allows the radio to automatically find the five strongest stations in an area and program
them into the memory of the FM & AM band.
Back stand
Antenna swivels and rotates
Runs on four AA batteries.

Well, the sensitivity is quite good. Steps in 1 KHz increments. No tuning knob but the slew tuning buttons work just fine. It's about the size of a paperback book and can be taken anywhere reasonably well. No carrying strap,
though. The SW coverage is limited but it grabs the major broadcasters exceptionally well. Example: the 41 meter band is covered from 7100 to 7300. So if you want to listen to the BBC on 7325, you're oput of luck.

However, I like to listen to the BBC on 12095 or 15070 European signals during the day that I cangrab when I attach a long wire.

The 3625 can't tune these freqs. but it can grab 15400 (from africa) WITHOUT a long wire antenna! I'm pretty impressed.

Bottom line....A GREAT little travel radio for $70.00! Call a Magnavox outlet if you are interested.

****
Magnavox AE-3805 - 2

Great little digital portable. Good sensitivity, average selectivity. Covers MW (in 10 kHz steps only), FM (no stereo), and SW in two "bands": 3200-7300 kHz and 9500-21750 kHz. Built-in timer/clock (12 hour format only), 5 programmable memory locations per band. Great for travel use.

Purchased from Damark for $49 in May, 1993.

$50 from Damark closeout -- cheapie category

****
Emerson PSW-4010 - 1

Great analog portable. Good sensitivity and selectivity. Covers MW, FM (stereo through headphones), and SW in 8 bands (roughly split out as 13m, 16m, 19m, 25m, 31m, 41m, 49m, and 60/75/90/120m). An excellent travel portable.
This is the same radio as the Sangean SG-789.

Purchased from DAK for $49 in June, 1988.

****
Sony ICF-5900W - 1

Sony ICF-5900W was a good radio in its day, but isn't worth listing now.

****
Icom IC-R70 - 1

I purchased my R70 in early 1983. It came with a scratched plastic window for the digital display, which the factory replaced. It is an extremely sensitive receiver. I installed the FM detector board option, which is highly useful for Sub-Carrier detection from FM broadcast receivers in conjuction with the R70's ability to tune below 100khz without a frequency convertor. The so-called PassBand Tuning (PBT), in actuality an asymmetrical bandwidth narrowing control, is very mediocre with the factory 455khz filters. Replacing the 455Khz ceramic SSB filter with a Fox-Tango FT-44 2.4khz 8-pole crystal filter (equivolent to the ICOM FL-44) makes the passband filter work as one would want. The AM 455Khz ceramic filter is junk, and was replaced with a higher quality "4Khz" ceramic filter from the long-defunct Radio Plus firm. The actual specs for the 4Khz filter indicate that it is a slightly asymmetrical filter of 5.6Khz bandwidth, causing a slight degredation of the "highs" (The original spec is

for a 6Khz bandwidth; the 9Mhz AM filter is a 6-pole device). Inclusion
of both replacement 455Khz filters results in a combined shape factor
of much better than 2:1 on AM or SSB. In addition, the RF amplifier
was enabled for AM broadcast band use, and an MOV was placed across
the AC input for protection against voltage transients. [Actually,
a Transorb would be far better in defending against narrow transients.]
For awhile, I replaced the diode AM detector with a Shottkey diode,
but my ears could detect no difference in distortion, and so the
original AM diode was returned to the circuitry. It's been serviced
once by ICOM for an intermittant problem ($150 ouch). There exists
several modifications to enable selection of the 455Khz SSB filter
whilst in AM mode for additional selectivity.

YORX AM908 - 1

****
Drake R8 - 1

****
Drake SPR-4 - 1

****
Icom R-71A - 2

Eskab & Edvis of Sweden used to offer a Phase-Locked AM (PLAM) detector for
the R-70 and later R-71; they also offer a version for the NRD525. I have
the R71 version. It is a synchronous detector which allows selection of USB
or LSB via the IF filter/BFO offset. The PLAM board phase-locks one of the
R71 local oscillators (I forget which one, probably the BFO) to the AM
carrier. It contains its own product detector. The lock range is not very
large, perhaps +/- 20 Hz. The detector seems to have lower distortion than
the ICOM AM detector.

Compared to ECSSB, aside from the advantages of phase-locking the product
detector BFO, the PLAM unit also lowers the corner-frequency of ICOM's
low-pass audio filter, giving better bass response than normal SSB mode on
the R71. I find that this improves the intelligibility of the signal.

The PLAM board piggybacks in the mounting area for the ICOM FM option
board; both can coexist. Installation is somewhat difficult, as it involves
connecting over a dozen wires to various boards in the R71.

Eskab & Edvis also offered a 4 KHz 2nd IF crystal filter for the R71. This
installs fairly easily in place of the narrow CW filter. It is very much
better than the stock ICOM 6 kHz bandwidth, which is wide-open until it
hits at cheap ceramic filter in the 3rd (455 kHz) IF.

I don't know if Eskab & Edvis still offer the R-71 PLAM and 4 kHz filter.
They used to advertise in the WRTH.

Regarding other options: I believe Sherwood Engineering offers an outboard
synchronous detector for the R71 as well as other receivers. The Kiwa MAP

unit should also be adaptable to the R71.

Also, Dom Moman of Shortwave Horizons publishes a modification manual,
which details mods like enabling the preamp on MW, true pass-band tuning,
sub-10 Hz RIT, etc.

****
Kenwood R-2000 - 1

****
Kenwood R-5000 - 1

****
Kenwood TS-450-1

I know it's not a reciever, but since it has general coverage,I decided to
put it in here.The TS-450S iaN amateur transciever that costs little more than
a R-5000,and if you have your ham ticket or are thinking about getting it,may
be worth checking out if you are in the market for a new toy.I'd be willing
to bet the replacement for the 5000 will look just like the 450,just like the
5000 looks like the 450's predacessor,the TS440S.First thing it is EXACTLY
the same size as the 5000/440.Unlike the 5000/440,it has an LCD display that
is unlike any other I've ever seen.It is almost too bright!The brightness
cannot be adjusted,unfortunatly.The 450 recieves in all the standard modes
except for fax.It has a"normal"keypad unlike the 5000 and the aggravating
CW that is producewhen a major button is pressed can be silenced by y
-a simple menuss,you dont have to cut a wire like the 5000he S-Meter
is a bar-graph type that I like but some people dont.It also has an Audio
meter function that kin baffles me.I still dont know what use it is,but it
looks nice!Probably the most notable thing you will observe when using the
450 is the QUIET!It is so quiet,it seems strange the first couple of times you
use it.The AGC is non-defeatable and has a fast/slow toggle.It is the strangest
and slowest AGC I've ever seen,on slow the S-Meter just sits there and then
SLOWLY goes down.On fast,it just isn't quite so slow.It seems to work ok,but is
really odd.The stock filter for AM is a mile wide but you can add the YK88 AM
filter but you wll lose the open slot for the 8.83 ssb filter.I'm not sure,but
the 450 seems to have the same stock am filter the 5000 has.On SSB,it uses one
of the better Murata ceramic filters and is ok but the optional SSB filters are
highly recommended.The audio is FANTASTIC on all modes and if you put one of
the minimus speakers from Radio Shack on it,you will like it a lot.Dont bother
with the Kenwood speakers,the one that goes with the 450 is not too good and is
expensive too!The ergonomics are pretty good,except for the tuning knob,yes
like all the recent vintage Kenwood rigs,IT DOESN'T HAVE A FINGER HOLE!!Why
does Kenwood insist on putting these awful knobs on all the rigs they have made
lately!All in all,it is a very good riever in almost all respects,and since t
it only costs about $100 more than a 5000,it is worth a lookND as a bonus,
the recieve coverage goes up to 40 mhz!If you are into low band scanning,you
will hear things on the 450 you never knew existed on your scanner.If you can
swing the 450's sister model the TS690,you can recieve all the way to 60 mhz.
When the 5000 is put out to pasture,if it's replacement is the 450 without the
transmitter,it will be very tough competition for the other makes.All it needs
is Sync.detection and you really couldn't ask for much more.

****
Japan Radio Company NRD-515

THE all time most user-friendly recieveof recent vintagHas PBT,analog fine tune,four I.F.bandwiths,AM,LSB,USB,and RTTY modes.There is no squelch but it really doesnt matter much.Of all the recievers I have owned,or ad over here to play with,it is the most sensitive in the SSB modeI have the standard 6 and 2.4 khz filters,and th600 and 300 hz filters whitch are great for RTTY or CW(if you are truly desparate!)The "protection"diodes have been removed due to intermod from a local AM station.The reciever's case,front and back panels are made of Aluminum,no plastic to crack on the 515!The audio in AM is very bad,almost as bad as the Icom R-71a,but in a different way.The audio is "fuzzy"out of the speaker jack,but not too bad out of the record jack but still a little "fuzzy".In the SSB modes,the audio is pretty clear and doesn't fatigue me like the Icom dos far as thergonomics goes,it's almost prefect!All the knobs are the right size,the tuning knob is large and has a nice deep finger hole(Kenwood,are you listening???).The S-meter is big and easily seen across the room.Dynamic range is very good after the diodes have been clipped(a one minute operation).The filters all are good quality and have good shape factors.This was the first "affordable"rig that had a memory option that was worth something with 24 or 96 channels available. The NDH-518 I have(96 ch.)is also made totally out of cast and sheet aluminum and matches the 515's styling.It stores frequency only,unfortunatly, due to the year it was designeIm guessing.There are lots of these recievers floating around on the used market for about $600 or so.Universal seems to have a lot of them passing thrgh the store.

****
Japan Radio Company NRD-525 - 1

This is a great reciever,marred only by bad audio and a hiss that will drive you bonkers if you have good hearing and a speaker that can put out the highs. I have had two of these,the first I traded for a sateite setup,and the one I have now.The newer reciever has mucbetter audio then the first one and lesess hiss too.Ergonomics are very good MUCH,MUCH better than the Drake R-8.(IMHO,the Drake is seriously overrated and all the stuff about made in the U.S.A.is kind of funny cause a LOT of the innards are MADE IN JAPAN!!!)Oh well,back to the 525,if you are into AM,it's probably not the reciever for you, but in allthe other modes,it is one of the best consumer grade recievers ever made.Performance in all modes is basically excellent except fothe audio pr problem,and stability is rock solid.JRC has only cut a few corners compared to the 515,probably the ultimate in construction for consumer recievers. The case is made of very thin sheet metal and the front panel is plastic.The keys fit loose in the keypad but work ok.The display has four brightness levels and is very easily read from across the room.The S-Meter is "digital" and is a floating vertical bar segment that seems to be yellow on some samples, and green on some others.It is sort of "spastic"and twitched a lot on the first one I had,but not as much on the seconone.The first 525 I had would "click" on strong AM signals,but the new one doesn't.The main tuning knob spins very smoothly and has a nice finger hole.(KENWOOD,WHY DONT YOU LISTEN!!) All in all, a great reciever.

Yaesu FRG-100 - 1

****
Panasonic RFB-65L - 2

$220 from Universal, EEB, etc. -- my main set, an excellent
portable, many features, nice construction and details.

****
Sony SW-55 - 2

This is my principal radio at the present time (I also have the
Sony ICF-SW33 and the Sony 7601). This rig is an extremely
sophisticated piece of equipment. I especially like the fact
that you can store up to 125 frequencies on 25 electronic pages
that can be named as you wish (by country). Once programed this
is very convenient. The two filter selections are well chosen
(much better than the stock Sony 2010 filters). My use the radio
to copy WEFAX with excellent results attests to its stability
(and that it receives USB and LSB).

The versatile timer/alarm and tape remote feature allow
automatic recording with certain tape recorders (Sony and others)
of up to five times and frequencies in a 24 hour period. I use
this feature all of the time. Audio (stereo on FM) qualitity for
a portable is very good; better I believe than the stock 2010
although as with the 2010, it is improved with a set of external
speakers.

Unlike the 2010, the SW55 does not have synchronous detection.
That's too bad because I believe that if it had this feature it
would blow away
tition. As it stands it is an excellent radio. Most
interference can be eliminated with the narrow filter or moving
away from the interference a bit (the radio is tunable in steps
of 0.1 kHz) so the lack of sd is not critical. I really
believe that Sony did not include it because it would have then
had a very negative impact on sales of the SW77.

Would I buy this radio again. You bet! The only problem I've had
in the year an
owned it is that the lettering has worn off the 1, 5, 0 and EXE
keys on the keypad. That should not happen on a $300.00 radio!

I just got a SW-55 for Christmas and find it to be an outstanding radio. Now
that I've said that, you should know that I am new to all of this "DX-ing" (is
that how you say it?). However, I can tell you that it's reception with the
built-in antenna and with the included auxiliary antenna is very good. I found
that the radio comes pre-programmed with a number of stations (BBC, Radio
Moscow, etc.) and they come in great.

As for your questions, I've found the speaker in the SW-55 to be very high quality, delivering plenty of volume and good sound. There are several "tone" switches (news vs. music setting, etc.) that enhance the reception and its sound. And, the unit is packaged well for travel.

The radio itself has several nice features (I don't know how they compare to other radios since I didn't comparison shop). There are several output jacks that make it easy to connect to external speakers, tape recorders, headphones, etc. There are local/long distance antenna settings. There are lots of ways to set and look at the time (local, UTC, Daylight savings, etc.) There are alarms and sleep settings (for on the road).

The tuning portion is quite nice. The radio of course offers digital tuning (punching numbers in to get to a freq.). But I find that I often use the "analog" tuning dial as well to either fine tune a station or to see what else is out there.

Best of all, the unit is packaged well. As a new user, I have enjoyed the little things Sony has done to make this experience a good one for the new user. Everything from the documentation to the carrying case has made it quick and easy for me to start listening to short wave. Included is a book that is a publishing of all the various countries broadcasting, with their freqs and times. (I gather that these things change quite a bit, but I presume that Sony updates it often)

****
Philips AE3905 - 1

In short, in my experience, the AE3905 is no real great shakes. It looks neat as hell, and marks its owner as a man of taste and distinction with more money than brains (like I said, *I* have one). Its shortwave performance is mediocre. Using this in a hotel last February, I found that attaching the included reel antenna caused the radio to overload fairly badly. The batteries don't last very long. The filters included are fair, but you still get a fair amount of interference from adjacent stations (not as bad as some small portables, but not good). I certainly wouldn't want to use this as my primary radio. For portability, it's fantastic. I can listen to the BBC or VoA anywhere. The radio fits in my shirt pocket, although reception in my pocket isn't all that good. In short, the radio isn't worth what Philips charges for it, but if you've got more money than you know what to do with and a desire to have a flashy looking toy, it'll do. The radio has only recently been available in small quantities in the U.S., and appears to have been discontinued in Europe. I got a reconditioned copy for $179 from the Magnavox factory outlet in Kentucky. Universal lists the radio in their catalog for something like $250 new if I recall correctly. You're not likely to find it anywhere else.

****
WATKINS-JOHNSON HF-1000 HF RECEIVER

I will be doing a lot of comparisons to my other receiver, an NRD-525.
To give a basis for comparison, the NRD-525 has been upgraded by the
following modifications:

ESKA PLAM board with four added filters following the IF strip
Installation of ESKA Aux filter in the NRD Aux position
Installation of the JRC 1.8 KHz filter in the Narrow position
Replacement of RF chokes on the filter board with shielded units
ESKA agc modification

These modifications have improved the shape factor on the NRD's filters
from an average of 2.0:1 to 1.7:1 (60:6 dB). The ultimate rejection has
improved from about -60 dB to -75 dB. These modifications are noticeable
in on the air listening tests. The NRD hiss has been removed.

About two months ago, I bought another receiver, a Watkins-Johnson HF-1000.
I didn't really think this receiver would be much better than the NRD, and
I intended to return it if this was the case. I was wrong. The Watkins-
Johnson receiver is clearly superior to the NRD in on the air listening
tests, almost in every case. In rare cases it is a tie. The comparisons
are done using an A/B switch that switches both the RF and audio lines so
that comparisons can be made quickly on the same signal. Comparisons
were all done in ECSS mode with the receiver settings made as close as
possible to each other.

I also did some bench testing of both receivers, and the numbers that the
tests give are not all that much different for both receivers, with the
exception of filter shape factor. The HF-1000 shape factors run about
1.1:1 (60:6 dB). This does not explain the main difference between the
comparisons, however. The HF-1000 seems to be superior in pulling out weak
signals. I have heard many signals that are muddled and hard to understand
on the NRD-525 sound sharp and clear on the HF-1000. Several other points:

AGC: The digitally processed AGC on the HF-1000 is far superior to the
analog AGC on the NRD, even with the ESKA kit installed.
Notch filter: Again, the digital IF notch filter is superior.
Audio: The NRD audio has always sounded low frequency and mushy; audio
on the HF-1000 is crisp and clear. This is an important item.
Operating: I like the controls on the HF-1000. They are flexible, yet
easy to use. The set is a pleasure to operate.
Synthesizer spikes: The NRD has a synthesizer spike every 100 KHz.
While these are not all that strong, some of them fall on inconvenient
frequencies, like the propagation beacons on 14100 KHz. There are
a few spikes on the HF-1000 at even 2 MHz points.

The only shortcomings in the HF-1000 I've noticed are the lack of synchronous
detection (this is supposed to be sent out as an upgrade chip later), and
IF passband tuning would be useful in the SSB modes. It is present in CW.

As you have probably guessed, I'm real happy with this receiver. I think
it will be the last one I will have to buy for quite a while.

****
AR3000 - 1 (More Info is Available by e-mail from (jlloyd@cs.clemson.edu)

My general impression, is that this is anyhow a very good apparate. It offers continuous coverage 0.1 : 2036 Mhz, all mode, RS232 interfacing, quite good operating commands, triple conversion, 400 memories; it is very compact (small tabletop, 1.2 Kg.), semi-portable; its 13 auto-selected front-end band filters reduce to some extent unavoidable intermodulation. In general, this set offers a self contained and very well balanced compromise of a lot of different demanding features, but will show its best when fully interfaced.

Its price, here in Italy, has been varying greatly during the years. Therefore I cannot say how it really competes with the choice of HF receiver + scanner setup. It is still unclear to me how far is the AR3000 from dedicated traffic receivers.

I'm finding a number of defects and "whish it was" that I'm going to list (I would like to hear comments about), but perhaps I'm just pretending too much from a receiver in which something had to be traded off between versatility and performance. Please note that I have a 4 years old AR3000; some defects could have been amelio-rated in the 3000A, or may eventually be specific of my unit.

Hardware limits:

-AM selectivity is mediocre (approx 10 khz bandwidth). I feel the lack of a variable Am bandwidth. SWL in crowded bands is too often spoiled by the 5Khz whistle. Thinking it was a problem of i.f. detuning, I once sent it to the service to have it retuned, but with no perceivable gain.

-In AM I do experience blocking. A strong transmitter mutes any weaker adjacent signal lying some -+30 khz apart. I suspect this may be rather a problem of AGC voltage (see below on squelch), because the feedback signal is obtained from the previous to the last i.f. stage, which may have a larger than necessary (for AM) bandwidth.

-The squelch control (essential in search mode) is not very functional. On my set almost everything passes for knob positions below .3 and only >S6 passes when I increase to .5. It may be a problem of adjustment, but also reflect the inaccurate behaviour of the S-meter, which (I have no measurements to support) seems not properly logarithmic. I have the impression that weak signals give a high S readout when close to stronger ones, because the S-meter averages on a larger bandwidth than the demodulator.
Also, the squelch just mutes the a.f. output, but not the line out signal.

-The internal speaker fidelity is scarce. No tone controls exist. Clarity improves a lot when connected to an external speaker or lineout. No noise reduction circuitry is present. External audio equalization does a lot, but of course is not the cure for low selectivity.

-There is no i.f. direct output for say a spectrum analyzer or a different demodulator (say wide band AM for satellite or TV, stereo FM decoder, sinchro SB AM decoder). A modify could be to buffer it to a backpanel jack.

-Intermodulation IS present. I live very close to power MW transmitter,
and in the times they're on the whole band .5 : 2.5 Mhz is unusable,
with crosstalk on every possible combination of transmitter frequencies.
At evening I sometimes hear sw bc stations crosstalks on 20 : 30 Mhz, even
with a short random wire antenna. However, I don't hear crosstalk due
to FM transmitters, which are also close to my place. The 13 front
end filters seem to do their job, since strong signals don't cause
crosstalk out of their respective preselector bands.

-I'm not very satisfied with the small and clicking rotary tuning control. In
the AR3000a it has been replaced with a (I guess optically encoded) smooth
one. I would rather appreciate a jog-shuttle like the one on VCRs, and the mod
itself seems quite easy too.
The tuning is however digital, and stepping frequency causes clicks, which
eventually trigger the squelch threshold during search. The final a.f. is
briefly muted while stepping, but I prefer the line-out signal which is
unaffected and thus has a faster response.

-There is a single antenna input for the entire range. I think this however is
correct, because whichever choice on different antennas is entirely dependent
on the user setup, and should be rather left to an externally programmed
antenna switch.

-Some digital RFI is generated, expecially in the high HF and low VHF. A real
antenna connected with a shielded cable and a good earth however wash it out.

-Some small change in sensivity and background noise can be perceived when
passing across one of the 13 band boundaries (by the way, they are 0.1-0.5,
0.5-2.5, 2.5-10, 10-30, 30-50, 50-108, 108-136, 136-174, 174-224, 224-335,
335-500, 500-940, 940-2036 Mhz), but this is unavoidable, and also due to
the change of the superetherodyne scheme.

Software limitations:

-Scanning is already very versatile for such a small machine. However, auto
memory storage of catched frequencies was forgotten. Also, the oddities in
the S-metering (see above) impose manual choice when scanning non regularly
channellized bands.

-There is a priority channel lookup feature, but the attention threshold has to
be the current squelch position. Apparently (see
//ftp.funet.fi/pub/dx/receivers/mods/aor300.mod) in
the 3000a a programmable lookup time was implemented, but it is not present on
the 3000.

-The mode and the tuning step change are set with several keystrokes. I feel it
quite tricky, expecially considering that I generally have to switch quickly
between 50 Hz/SSB, 500Hz/Am, 1.25 Khz/nfm, 50 Khz/WFM. The step x10 command is
very useful, but not enough.

Since the S-meter signal is output on the RS232, and the unit may be fully
remotely commanded, all this limits can be cleverly threspassed by an external
control software, thought.

I have experienced problems with the 232 interface. The cpu goes crazy very easily when the connector is plugged in/out, unless the "remote" switch on pin 7 is previously operated. This is (I understand) the reason why it was added on the 3000a. When the cpu goes on the moon, one generally has to open the set and to push the reset button (backside of the keyboard), losing all the memories .
Also, I cannot interface the scanner with an Atari St, either because the TTL level Txdata is to low for that serial port or because the continuous output of the S-meter simply is too fast for the Atari bios.
Passing by, note that the RS232 speed can be set to 9600 baud with a switch on the cpu board.

I believe the ASTRO is Motorola's new digital radio. They would probably
use some sort of Securenet encryption to scramble the comms. The fact
that the radio is digital already helps in keeping eavesdroppers out.

You should really separate out the different facets of law enforcement before making such a generalization. Your right about the fact that most routine police work does not need encryption. It's the surveillance and 'special' investigation work that needs encryption. I've heard several cases of warrant searches being fruitless because the criminal had prior knowledge of the search through a scanner. The arrest of criminals who have firearms in their possession is another case. I'd rather the arrest be made in surprise then have the criminal lying in wait.

So this means they have a 200mhz gap between 800 and 900 mhz?
If so this really sucks, not only is cellular removed but truniking,
900mhz hams, paging etc????

You guys need to all thank the ARRL for telling the feds that
"geez, we have no objection to cellular being removed". You folks
may not like the NRA, but at least they take the position of no further
restictions, period when it comes to their area of interest.

We have no such organization to represent and lobby for our interests

| ICOM has announced they are removing the entire 800-900
| MHz portion from their R7100, R100, and R1 scanners.

The question is, will ICOM AMERICA import the chips necessary to restore the 800-900Mhz range, or will someone have to import them? They would be "replacement parts" for the original sets...

I'm sure Canadian firms could do a good business selling the appropriate ICs via FedEx into the USA. Nothing more pathetic than the Top-of-the-Line consumer VHF/UHF set being shafted by the Federeles...

| The popular Realistic PRO-2006 scanner has become the
| cellular-unrestorable PRO-2006A,

So, will the old microprocesser chips that contain the cellular capability still be availiable for "servicing?" Does the LCD display still contain the "30Khz" display segment? If so, will this PRO-2006A be strictly for the United States market, and so Canada & Mexico would have access to the original PRO-2006 with cellular capability? (IC chips from Europe would have the inappropriate "25Khz" channel spacing used by their cellular systems, so we want a North American IC with 30Khz spacing.)

| while the PRO-43 handheld
| remains unchanged due to the difficulty of restoring its
| cellular capability.

Well, now we know that "difficult to restore" does not necessarily mean that it is impossible ELECTRICALLY to restore, merely that Joe Blow would have a hard time attempting it with a blowtorch and gas pipe pliers.

Therefore, I foresee the "Next Generation" having the correct ICs to scan the US cellular bans, but that you will have to punch your way through a bunch of shielded cans. YEAH!!! Now, how the hell do we decypher that Digital Cellular stuff the telcos are foisting on us??

3412. BC2500XLT or AOR1000XLT

Which scanner is the best deal for the money,
the BC2500XLT or the AOR1000XLT? Both units are
about the same price around my location.

or should I spend the few extra bucks a pick up a ?

If you had the choice, which scanner would you buy?

Thanks inadvance-

M |Hi I am lookinf for frequencies lists for any overseas country..
M |Matthew

Hi, I am not having any complete lists, but I have put together a
brief list of frequency bands and their main use in NORWAY:

68 - 87.5 : An old band that are getting quieter and quieter.
Mainly used for Road Work.
Channel spacing: 25 KHz
Repeater out: 10 MHz +

146 - 155 : Fire, security etc.
Channel spacing: 25 KHz
Repeater out: 4.5 MHz +

158 - 174 : Fire, security, police (trunc) etc.
Channel spacing: 25 KHz
Repeater out: 8 MHz +

450 - 470 : Celluar (NMT450) plus some private repaters.
Channel spacing: 25 KHz
Repeater out: 10 MHz +

890 - 960 : Celluar (NMT900 + GSM) plus cordless.
Channel spacing: 12.5 KHz
Repeater out: 45 MHz +

PRO-43 - can't beat the feeling

From: jacob@altair.csustan.edu
Message-ID: <CpAIu4.Fy8@koko.csustan.edu>
Source record: 274770

Does anyone out there who is familar with the internal
structure of the R-100 care to comment on the
feasibility of the following modifications:

1. Adding some sort of BFO circuitry?

2. Narrowing (or at least improving) the IF bandwidth.
(would replacing the 455 ceramic resonators with
real 455khz crystals do any good?)

Any comments would be appreciated.

Cheers, Dave

As a side note, our Plano, Texas police department went to 800MHz trunked freqs about a year ago. They always get new toys from the rich folks taxes but that's another story. Anyway, I heard them using encription yesterday afternoon. It sounded a lot like the FBI's DES. There was no mistaking it. So, I guess our "plain-ol" town is getting pretty sophisticated. The trunked freqs are a real pain to listen to in the day hours because everyone from the sewer man to the dog catcher is on them :-(After hours monitoring can be fun though. A lot of them like to use their cell phones for privacy during those late night hours :-)

Since there is no chance of me getting a MVT-7100 in the near future... which of the above would you most favor as your second pick? I would not mind having the 1500, but have heard some bad things about it like intermod troubles, insensitivity, and, is there a lot to listen to on SSB and good enough selectivity below 30 MHZ? It couldn't be worse than my Pro2022 I used to have... Should I just get the 1000 and the not much better sensitivity for just $40 less? The Pro43 is the best for its price range, but it isn't continous coverage or as rangy as the AORs. I am a new ham that hasn't much been interested in operating telephone but would like an HT that could do double duty as an occasional scanner, but I know I will be sacrificing a lot of things like selectivity and step increments. Any one I choose, I'll be doing something stupid anyway if the scanning hobby is killed by digital...

Thanks. Actually, two things you might want to know:

22 is the Coast Guard to non-CG frequency, where you'll hear plenty of traffic between boaters and the CG...

21A and 23A are the two main CG interservice frequencies; if there's something big going on those two will be the ones the Guard talks on...

> I am. Protecting the public involves efforts to protect the integrity
> of sensitive law enforcement operations as well as restricted info
> (criminal histories) or information generally deemed to be private.

Ah, that's the crux of the matter. What information is generally deemed to be private. In fact a lot of law enforcement information is not private. For example, in Missouri the police blotter is open for public inspection for a minimum of thirty days. You don't need to be a cop, a lawyer, or a reporter to look at it. Any member of the public can inspect it. Although, in practice, some police departments may refuse your request unless you get a court order. Perhaps more annoying, is some police departments are now charging the public (but it is often waived for lawyers, and reporters) an "inspection fee." There are also periodic battles whether other police logs such as 911-tape recordings, radio recordings, or MDT computer files are confidential or not.

Why should the public be allowed to review law enforcement records? Of course there are the issues of public accountablity and oversight. Are the police slower to respond to certain neighborhoods than other neighborhoods? Are drivers of a certain race being stopped more than other motorists? Are official vehicles being misused for personal use?

When law enforcement officials are acting in their official capacity, they have to assume their actions are going to be subject to public scrutiny. If they are using police department equipment, they shouldn't be surprised if people assume they are acting in their official capacity. Don't use police department stationary to write love letters to your spouse, and don't use police department radios for private discussions.

Message-ID: <2dc83053@f747.n115.z1.fidonet.org>
Source record: 274688

ve> My new Radio Shack sales flyer lists the Pro46 handheld
ve> scanner on sale for $189.95, down from $229.95.

ve> Any comments on the quality of this scanner? Is there
ve> an easy restoration of cellular freq's? I checked out
ve> ftp at oak.oakland.edu and didn't see anything. They
ve> did have a number of mods for the 2006 which I just
ve> bought (luv it!).

Hi, Charles...Haven't heard too many comments about it. The unit is made
by Uniden for RS. Sort of similiar to the BC 200 XLT.

Product: Realistic PRO-46 by Radio Shack
Purpose: Restoration of full 800 Mhz coverage

The modification of this unit is from the May, 1993 issue of
Monitoring Times, published by Grove Enterprises.

** Disclaimer: All modifications are done at your own risk. This
product uses surface mount components which can be easily damaged.
Do not perform this modification if you are not experienced with
this type of circuitry. This will void the warranty of your scanner.

** Listening to certain portions of the 800 Mhz band is prohibitted
by United States law.

Modification of PRO-46 for full 800 Mhz coverage with 30 Khz stepping
available.

1. Remove the battery pack, battery door and antenna.
2. Remove the four black screws from the back of the radio, then
push upward on the bottom of the rear of the case, carefully
swinging it upward and removing it.
3. Carefully insert a small screwdriver between the two boards
next to the interconnect plug in the lower right corner. Gently
pry the top board up to separate it and set it aside.
4. Unsolder the copper-coated plastic shield from the microprocessor
and set it aside. ** CAUTION!! Too much heat will damage the
shield. **
5. Locate the two chip jumpers imprinted with "0". Carefully unsolder
and remove both.
6. Solder one chip jumper across the two upper most unused solder
pads. (Soldering a jumper across the lower two pads changes the
30-50 Mhz band to 68-88 Mhz.)
7. Reverse steps 1-4. The modification is completed.

3429. Pro 43 Modification

Newsgroup: rec.radio.scanner
Date: 1994-05-04 22:36:33 UTC
From: Jerry.Smith@f747.n115.z1.fidonet.org
Message-ID: <2dc83055@f747.n115.z1.fidonet.org>
Source record: 274685

Product: Realistic Pro-43
Purpose: Restore full 800 Mhz continuous coverage

Modification is from the publication Monitoring Times
September, 1992 Page 107

** Warning...This procedure will void your warranty

** Do not attempt this modification unless you are familiar with small component soldering. Performing this modification is done at your own risk. If you don't feel comfortable doing the mod, DON'T.

** Static damage is quite possible as the modification involves work near the microprocessor. A static strap is highly recommended.

** This modification restores certain portions of the 800 Mhz band that is against U.S. federal law to monitor.

Tools needed...Fine point low powered soldering iron, solder wick or de-soldering tool (I recommend the wick), pointed awl, hemostats or pointed tweezers, small phillips screwdriver, solder.

1. Remove the battery, antenna and back cover (held in place by four screws)

2. Remove the six screws holding the top circuit board in place. Carefully unsolder the two antenna connections from the board. Bend the antenna ground tab fully up form the board. Crefully lift the board, unplugging the black connector at its base, and lay the board out of the way on its bundle of colored wires.

3. Remove the two screws from the next board and lift it, carefully unplugging the white connector at the bottom of the board. Lift it up and lay it aside on its brown wire (which can be unplugged if necessary).

4. Unsolder and remove the metal shield from the final board, revealing the microprocessor; note the row of diodes labelled D1-D5 above it. Only diodes D1, D2 and D4 are present; assisted by a pointed tool, unsolder and remove D4; the lone diode. (This restores full 800 Mhz continuous coverage which will use 30 khz stepping when appropriate.)

5. Re-assemble the scanner, paying particular attention to the alignment of the plugs. Test the radio by entering any frequency in the 800 Mhz band that could not be programmed before.

Modification is complete.

Jerry

3430. Scanners

I learned today, that listening to the nj state pd freq's
on trunking (800) that the recently installed
call boxes along route 295 in gloucester county actually are like
a phone (hesitation from calling it a cell phone)
that call central dispatch, and they relay it to the local pd,
the funny part is that they (the dispatchers)
don't appear to know know what box is calling, and
they don't know that it is even a call box, from the way they
were talking. "Oh, you are calling from a call box?"
But nevertheless, it is interesting.
(I never heard the voice calling, just the dispatcher.)

Oh, the most important part of the whole thing is that the
frequencies that are used for the call boxes are the same as the
nj state trunking frequencies!! Pretty cool-o , Huh?

my question is, that If I hear them on the trunking frequencies
assigned for the state pd, then can the state pd cars actually talk
to them or can they hear them?

Subject: George Gilder's Seventh Article - Auctioning The Airwaves

This series of articles by George Gilder provides some interesting technological and cultural background that helps prepare readers to better understand and place in proper perspective the events relative to the National Data Super Highway, which are unfolding almost daily in the national press. I contacted the author and Forbes and as the preface below indicates obtained permission to post on the Internet. Please note that the preface must be included when cross posting or uploading this article.

The following article, AUCTIONING THE AIRWAVES, was first published in Forbes ASAP, April 11, 1994. It is the seventh article in a series excerpted from chapters in George Gilder's book, Telecosm, which will be published 1995 by Simon & Schuster, as a sequel to Microcosm, published in 1989 and Life After Television, published by Norton in 1992. Further chapters of Telecosm are scheduled to be published in future issues of Forbes ASAP.

Please post Auctioning The Airwaves to any Usenet newsgroups deemed suitable.

AUCTIONING THE AIRWAYS

BY

GEORGE GILDER

Imagine it is 1971 and you are chair of the new Federal Computer Commission. This commission has been established to regulate the natural monopoly of computer technology as summed up in the famous Grosch's Law. In 1956 IBM engineer Herbert Grosch proved that computer power rises by the square of its cost and thus necessarily gravitates to the most costly machines. According to a famous IBM projection, the entire world could use some 55 mainframes, time-sharing from dumb terminals and keypunch machines. The owners of

these machines would rule the world of information in an ascendant information age. By the Orwellian dawn of 1984, Big Bre'r IBM would establish a new digital tyranny, with a new elite of the data-rich dominating the data-poor.

As head of the computer commission, you launch a bold program to forestall this grim outcome. Under a congressional mandate to promote competition for IBM and ensure the principle of universal computer service, you ordain the creation of some 2,500 mainframe licenses to be auctioned to the highest bidders (with special licenses reserved for minorities, women and farmers). To ensure widespread competition across all of America, you establish seven licenses in each metropolitan Major Trading Area and seven in every rural Basic Trading Area as defined by Rand McNally. To guarantee universal service, you mandate the free distribution of keypunch machines to all businesses and households so that they can access the local computer centers.

In establishing this auction in 1971, you had no reason at all to notice that a tiny company in Mountain View, Calif., called Intel was about to announce three new technologies together with some hype about "a new era of integrated electronics." After all, these technologies -- the microprocessor; erasable, programmable read-only memory (EPROM); and a one-kilobit dynamic random access memory (DRAM) -- were far too primitive to even compare with IBM's massive machines.

The likely results of such a Federal Computer Commission policy are not merely matters of conjecture. France pretty much did it when it distributed free Minitel terminals to its citizens to provide them access to government mainframes. While the United States made personal computers nearly ubiquitous buying perhaps 100 million since the launch of the Minitel in the late 1970s the French chatted through central databases and ended up with one-quarter as many computers per capita as this country, and one-tenth the number of computer networks. Today, PC networks are leading the US economy to world dominance while Europe founders without a single major computer company, software firm or semiconductor manufacturer.

IT IS NOW 1994, and Reed Hundt, the new chairman of the Federal Communications Commission, is indeed about to hold an auction.

Rather than selling exclusive mainframe licenses, the current FCC is going to sell exclusive ten-year licenses to about 2,500 shards of the radio spectrum. Meanwhile, a tiny company called Steinbrecher Corp. of Burlington, Mass., is introducing the new microprocessor of the radio business.

In the world of radio waves ruled by the Federal Communications Commission, the Steinbrecher MiniCell is even more revolutionary than the microprocessor was in the world of computing. While Intel put an entire computer on a single chip, Steinbrecher has put an entire cellular base station -- now requiring some 1,000 square feet and costing $ 1.5 million -- in a box the size of a briefcase that costs $

100,000 today. Based on a unique invention by Donald Steinbrecher and on the sweeping advance of computer technology, the MiniCell represents a far bigger leap forward beyond the current state of the art than the microprocessor did. What's more, this MiniCell is in fact much superior to existing cellular base stations. Unlike the 416 hard-wired radio transceivers (transmitter-receivers) in existing base stations, the MiniCell contains a single digital broadband radio and is fully programmable. It can accommodate scores of different kind of cellular handsets.

Most important, the MiniCell benefits from the same technology as the microprocessor. Making possible the creation of this broadband digital radio is the tidal onrush of Moore's Law. In an antithesis of Grosch's Law, Gordon Moore of Intel showed that the cost-effectiveness of microchip technology doubles every 18 months. This insight suggested the Law of the Microcosm -- that computing power gravitates not to the costliest but to the cheapest machines. Costing $ 100,000 today, the MiniCell will predictably cost some $10,000 before the turn of the century.

In time, these digital MiniCells will have an impact similar to that of the PC. They will drive the creation of a cornucopia of new mobile services -- from plain old telephony to wireless video conferencing -- based on ubiquitous client/server networks in the air. Endowing Americans with universal mobile access to information superhighways, these MiniCells can spearhead another generation of computer-led growth in the US economy. Eventually, the implications of Steinbrecher's machines and other major innovations in wireless will crash In on the legalistic scene of the FCC.

And that's only the beginning of the story.

Going on the block in May will be 160 megahertz (millions of cycles per second) of the radio frequency spectrum, divided into seven sections of between 10 and 30 megahertz In each of 543 areas of the country, and devoted to enhanced Personal Communications Services (PCS).

Existing cellular systems operate in a total spectrum space of 50 megahertz in two frequency bands near the 800 megahertz level. By contrast, PCS will take four times that space in a frequency band near two gigahertz (billions of cycles per second). Became higher frequencies allow use of lower-power radios with smaller antennas and longer-lasting batteries, PCS offers the possibility of a drastically improved wireless system. Unfortunately, the major obstacle to the promise of PCS is the auction.

Amid the spectrum fever aroused by the bidding, however, new radio technologies are emerging that devastate its most basic assumptions. At a time when the world is about to take to information superhighways In the sky -- plied by low-powered, pollution-free computer phones -- the FCC is in danger of building a legal

infrastructure and protectionist program for information smokestacks and gas guzzlers.

Even the language used to describe the auction betrays its fallacies. With real estate imagery, analysts depict spectrum as "beachfront property" and the auction as a "land rash." They assume that radio frequencies are like analog telephone circuit: no two users can occupy the same spot of spectrum at the same time. Whether large 50-kilowatt broadcast stations booming Rush Limbaugh's voice across the nation or milliwatt cellular phones beaming love murmurs to a nearby base station, radio transmitters are assumed to be infectious, high-powered and blind. If one is on the highway, everyone else has to clear out. Both the prevailing wisdom and the entrenched technology dictate that every transmitter be quarantined in its own spectrum slot.

However, innovations from such companies as Steinbrecher and Qualcomm Inc. of San Diego overthrow this paradigm. Not only can numerous radios operate at non-interfering levels in the same frequency band, they can also see other users' signals and move to avoid them. In baseball jargon, the new radios can hit 'em where they ain't; in football idiom, they run for daylight. If appropriately handled, these technologies can render spectrum not scarce but abundant.

These developments make it retrograde to assign exclusive spectrum rights to anyone or to foster technologies that require exclusivity. Spectrum no longer shares any features of beachfront property. A wave would be a better analogy.

The New Rules Of Waves

In the early decades of this century, radio was king. Electronics hackers played in the waves with a variety of ham, citizens band and short-wave machines.

Experimenting with crystal sets, they innocently entered the domain of solid-state devices and acquired some of the skills that fueled the electronic revolution in the United States and the radar revolution that won World War II. The first point-contact transistor, created by John Bardeen and Walter Brattain at Bell Labs in 1948, functioned like a crystal radio. The first major solid-state product was a 1954 Texas Instruments pocket radio with six germanium transistors.

Over the following decades, the radio became a mass commodity. There are now some 230 million radios in the United States alone, not even including more than 16 million cellular phones (which are in fact portable two-way radios). Radios roll off Asian assembly lines at a rate that might be meaningfully measured in hertz (cycles per second), and they come in sizes fit for pockets, belts, watches and ears. But the romance of radio has died and given way to the romance of

computers.

Today it is PC technology that engages the youthful energies previously invested in radio technology. The press trumpets a coming convergence between computers and TVs and games and films. But no one talks much about radios. For many years, we have been taking radios for granted.

As the foundation of wireless communications, however, radio -- no less than TV or films -- will burst into a new technoscape as a result of a convergence with computers. The hackers of the '50s and '60s are joining forces with the hackers of the '80s and '90s to create a new industry. Moore's Law is about to overran the world of radio.

You double anything every 18 months and pretty soon you find yourself with a monster. During the 1970s and 1980s, Moore's Law overturned the established order in the computer industry and spawned some 100 million personal computers that are as powerful as million-dollar mainframes were when the revolution began. In the current decade, Moore's Law is upending the telephone and television industries with interactive teleputers that will be able to send, receive, shape and store interactive full-motion video. And during the next five years, Moore's Law is going to transform exotic and costly radio equipment once consigned to the military and outer space into the basic communications access routes for the new world economy.

To understand this new world of radio, however, you must forget much of what you learned about the old world of radio. For example, these new radios differ radically from the radios of the past in the way they use spectrum, the way they interfere with one another and the way they are built.

For some 15 years, a hacker of the 1950s named Don Steinbrecher and a small group of students and associates have been making the world's most powerful and aerobatic radios. Steinbrecher radio gear can soar to spectrum altitudes as high as 94 gigahertz to provide radar "eyes" for smart bombs and pies, plunge down to the cellular band at 800 megahertz to listen in on phone calls or drop discretely to 30 megahertz -- waves that bounce off the ionosphere -- for remote over-the-horizon radar work identifying cocaine traffickers flying in low from Latin America. At the same time, some of these radios may soon command enough dynamic ranges of accurate broadband reception -- rumored to be as high as 120 decibels (one trillion-to-one) -- to detect a pin drop at a heavy-metal rock concert without missing a high-fidelity note or twang.

Like every radio transceiver, a Steinbrecher radio must have four key components: an antenna, a tuner, a modem and a mixer. The antenna part is easy; for many purposes, your metal shirt hanger will do the trick (backyard wire fences collect millions of frequencies). But without tuners, modems and mixers, nothing reaches its final

destination -- the human ear.

A tuner selects a desired carrier frequency, usually by exploiting the science of resonant circuits. A modem is a modulator-demodulator. In transmitting it applies information to the carrier frequency by wiggling the waves in a pattern, called a modulation scheme, such as AM or FM. In receiving the modem strips out (demodulates) the information tom the carrier wave.

The key to Steinbrecher radios is the broadband mixer. It surmounts what was long seen as an impossible challenge: moving a large array of the relatively high career frequencies on the antenna down to a so-called baseband level where they can be used without losing any of the information or adding spurious information in the process. Compared to FM carrier frequencies of 100 megahertz or even PCS frequencies of two gigahertz, baseband audio frequencies run between 20 hertz and 20 kilohertz.

Mixers were the basic Steinbrecher product, and in 1978 and 1980, Steinbrecher acquired patents on a unique broadband mixer with high range and sensitivity called the Paramixer. Even to its expected military customers, the Paramixer was a hard sell because other radio components were unable to keep pace with its performance. Today, however, the Paramixer is the foundation of the Steinbrecher radio in the MiniCell.

In the old world of radio, transceivers integrated all of these components -- antenna, tuner, modem and mixer -- into one analog hardware system. Because the radio is analog and hard-wired, its functions must be standardized. Each radio can receive or transmit only a very limited set of frequencies bearing information coded in a specific modulation scheme and exclusively occupying a specific spectrum space at a particular power range. If you are in the radio business -- whether as an equipment manufacturer such as Motorola or Ericsson, a provider of services, such as McCaw or Comsat, or a broadcaster, such as NBC or Turner -- you care deeply about these hard-wired specifications, frequencies and modulation schemes.

Comprising the "air standard," these issues embroil businesses, politicians, standards bodies and regulators in constant warfare. For everything from High Definition Television to digital cellular and cordless telephony, standards bodies are wrangling over frequencies and modulation schemes.

How Digital Radios Can End The Spectrum Wars

To the people at Steinbrecher Corp., all these wrangles seem utterly unnecessary. With antennas, tuners, modems and mixers, wideband digital radios perform all the same functions as ordinary radios. Only the antenna and mixer are in hardware, and these are generic; they don't care any more about air standards than your shirt hanger does.

In Steinbrecher radios, all of the frequency tuning, all of the modulating and demodulating, all of the channelization, all of the coding and decoding that so embroil the politicians are performed by programmable digital signal processors and can be changed at a base station in real time. Strictly speaking, the tuner and modem are not part of the base station radio at all. The broadband radio in a Steinbrecher base station can send or receive signals to or from any handset or mobile unit operating within its bandwidth (in current cellular systems the full 12.5 megahertz of the band; in PCS, still larger bands of as much as 30 megahertz).

All the processing of codes, frequencies, channels and modulations, as well as all special mobile services, can move onto computers attached to the network. Steinbrecher technology thus can open up the spectrum for open and programmable client/server systems like those that now dominate the computer industry. Moore's Law, in fact, is changing radios into portable digital computers. The most pervasive personal computer of the next decade will be a digital cellular phone operating at least 40 MIPS (millions of instructions per second).

Today the performance of analog-to-digital converters defines the limits of Steinbrecher radios. Even if the mixers are perfect, the system's performance can be no better than the accuracy of the A/D processors that transform the output of the mixers into a digital bit stream for the DSPs. Steinbrecher estimates that better broadband A/D converters -- which can sample wave forms more accurately at high frequencies -- could increase the performance ofSteinbrecher systems by an amazing factor of 10. Pushed by demands and designs from Steinbrecher, Analog Devices and other suppliers are advancing converter technology nearly at a pace with Moore's Law, and Steinbrecher's broadband digital radios are rapidly approaching the ideal.

As Don Steinbrecher puts it, broadband A/D and DSP have changed wireless "turn a radio business to a computer business." At first, the computer portion of a broadband radio was very expensive. Until the early 1980s, military customers performed advanced broadband analog-to-digital conversion and digital signal processing on million-dollar custom supercomputers. In 1986, an advanced DSP system for graphics at Bell Labs entailed the use of 82 AT&T DSP32 chips and supporting devices in a custom computer that cost some $ 130,000. Today, these same functions are performed on an Apple Quadra 84o AV using an AT&T 3210 running at 33 megaflops (million floating-point operations per second) and 17 MIPS for under $ 20 in volume. This rising tide of advances in digital technology, propelled by Moore's Law, is about to sweep Steinbrecher's recondite radio company into the midst of a mass market in cellular telephony.

And the entire cellular and PCS industries will be beating a path to Steinbrecher's door. Just as millions of people today have learned the meaning of MIPS and megabytes, millions of people around the

world, believe it or not, are going to come to understand the meaning of "spurious-free dynamic range."

As a very rough analogy, imagine cranking the volume of your radio as high as possible without marring the desired signal with static and distortion. The spurious-free dynamic range of your radio would measure the distance between the lowest and the highest volumes with a clear signal. In more technical terms, spurious-free dynamic range is defined as the range of signal amplitudes that can simultaneously be processed without distortion or be resolved by a receiver without the emergence of spurious signals above the noise floor.

In building broadband radios with high dynamic range, however, Steinbrecher faced a fundamental technical problem. As a general rule, bandwidth is inversely proportional to dynamic range. You can have one or the other, but you can't have both. The broader the band, the more difficult it is to capture all of its contents with full accuracy and sensitivity or with full spurious-free dynamic range. An ordinary radio may command a high dynamic range of volumes because it is narrowband.

But Steinbrecher radio does not begin by tuning to one frequency alone; it gasps every frequency in a particular swath of spectrum. In some extreme Paramixer applications (94-gigahertz radar, for example), the bandwidth could be 10 gigahertz -- larger than the entire range of spectrum commonly used in the air, from submarine communications at 60 hertz to C band satellite at 6 gigahertz.

In most Steinbrecher applications that require high dynamic range, however, the bandwidth runs between a few megahertz and hundreds of megahertz (compared to 30 kilohertz in a cellular phone). Unless all of the frequencies captured by the broadband radio are really present in the band rather than as artifacts of the equipment -- in technical jargon, unless the signals are spurious-free -- the radio user cannot tell what is going on, cannot distinguish between spurs and signals.

Steinbrecher has devoted much of his career to the graft of spurious-free dynamic range. Soon after he arrived at Massachusetts Institute of Technology in September 1961 to pursue work on device physics, he moved into the school's new Radio Astronomy Lab. The radio astronomers were using millimeter waves at 75 gigahertz to probe remote galaxies and pour through evidence of a big bang at the beginning of time. Because the return reflections from outer space were infinitesimal, the radio telescopes had to command a bandwidth of at least two gigahertz, a spurious-free dynamic range of more than 100 decibels (tens of billions-, or even trillions-to-one) and noise levels of less than 10 decibels (millionths of a watt).

The telescope signals turned out not to be spurious-free. More than 90 percent of the receiver noise -- the spurious signals --

originated in the frequency converter or mixer, which translated the 75-gigahertz millimeter waves in cascading analog stages of diodes and transistors, fed by tunable local oscillators, down to baseband levels that could be usefully analyzed. This impelled Steinbrecher's obsession with spurious-free dynamic range in mixers.

To achieve high dynamic range in broadband mixers, Steinbrecher discovered, was chiefly a problem of the basic physics of diodes. At the University of Florida, at ECI Corp. and at MIT, Steinbrecher had pursued studies in device physics focusing on the theory of PIN junctions -- the positive-negative interfaces that create the active regions in diodes and transistors. How cleanly and abruptly they switch from on to off -- how fully these switches avoid transitional effects--determines how well they can translate one frequency to another without spurs.

From this experience, Steinbrecher concluded in 1968 that receivers could be built with at least a thousand times more dynamic range than was currently believed possible. He assigned his student Robert Snyder to investigate the issue mathematically, integrating the possible performance of each component into the performance of a mixer. Snyder's results stunningly continued Steinbrecher's hypothesis. They predicted that in principle -- with unlimited time and effort -- the linearity and dynamic range of a radio could be improved to any arbitrary standard. In a key invention, Steinbrecher figured out how to create a diode circuit that could produce a perfect square wave, creating a diode with essentially zero switching time.

Steinbrecher then proceeded to put his theory into practice by developing the crucial diode and field-effect transistor arrays, mixers, amplifiers and other components necessary to build a working system of unparalleled dynamic range. Most of their advances required detailed knowledge of the behavior of P/N junctions. To this day, the performance of Steinbrecher's equipment depends on adjustment to unexpected nonlinearities and noise sources that were discovered as part of Robert Snyder's work but are still not integrated into the prevailing models of diode behavior.

Beyond radio astronomy, the people who were interested in analyzing signals of unknown frequencies, rather than tuning into preset frequencies, were in the field of military intelligence. Enemies did not normally announce in advance the frequencies they planned to use or how they would modulate them. Steinbrecher Corp.'s first major contract came in the early 1980s for remote over-the-horizon radar (ROTHR) systems used to detect planes carrying drugs from Latin America. Steinbrecher also won contracts to supply MILSTAR satellite transceivers and 94-gigahertz "eyes" for smart munitions and jet aircraft.

In 1986 these large potential businesses began to attract venture capitalists, including EG&G venture partners, The Venture Capital Fund of New England and Raytheon. As often happens, the venture

capitalists sought professional management. They pushed Steinbrecher upstairs to chairman and summoned a Stanford EE graduate named Douglas Shute to manage the company's move from a manufacturer of hard-sell mixers Into a producer of revolutionary digital radios.

Still, Steinbrecher Corp. long remained a tiny firm occupying a dingy one-story building in a Woburn, Mass., industrial park, where it rarely pulled in more than $ 5 million in revenues. Not until the early 1990s, when its technology converged with Moore's Law, did the company begin to escape its niche.

Collision With Texas Instruments' DSP

Indeed, strictly speaking even Moore's Law was not enough to make this Pentagon turkey fly. Crucial was Texas Instruments' mid-1980s campaign to remake the digital signal processor into a commodity device comparable to Intel's microprocessor. Creating development systems and software tools, TI transformed the DSP from an exotic and expensive printed circuit board full of integrated circuits into a single programmable microchip manufactured in volume on the same factory floor the company used to produce hundreds of millions of dynamic random access memories. The results exceeded all expectations. Outpacing Moore's Law by a factor of nearly four for some eight years so far, DSP cost-effectiveness began soaring tenfold every two years. Pricing the devices for digital radios, Douglas Shute saw that the wideband digital radio had "moved onto the map as a commercial product."

Also in 1989, a secret contractor asked the company if its radios could snoop on calls in the cellular band. After gigahertz explorations in radio astronomy and military projects, the 12.5 megahertz of the cellular bandwidth seemed a piece of cake. Although this national security application never came through, the idea galvanized the company. If it should need a commercial market, cellular telephony was a good bet.

The pull of opportunity, however, is usually less potent than the push of catastrophe -- which is the key reason for socialism's failure. Insulating the economy from failure, it also removes a key spur for success. For all the bureaucratic rigmarole of military procurement, producers for the Pentagon live in a relatively comfortable socialist world of cost plus contracts.

In 1989, however, just before the fall of the Soviet Union, Steinbrecher began to get clear signals from Washington that the market for his products was about to collapse. MILSTAR remained an experimental program; the ROTHR system was halted after the creation of just four stations with 1,600 mixers; and suddenly the cellular opportunity was not merely an attractive option -- it was crucial for survival.

When Shute and Steinbrecher viewed the cellular scene in the United States, however, they became increasingly disdainful. These radio companies had no more idea of what was possible in radio technology than had the MIT engineering lab when he arrived in 1961. Indeed, Steinbrecher Corp.'s first potential customer -- a wireless colossus -- refused even to meet with Shute: The chief technologist said he had investigated digital radios several years before and determined they were unable to achieve the requisite dynamic range. Moreover, at scores of thousands of dollars apiece, digital signal processors were far too expensive. Most cellular executives, along with their Washington regulators, seemed stuck in a 1970s time warp when analog still ruled and DSP was a supercomputer.

Importing Obsolescence

As a result, the entire industry was convulsed by what Shute and Steinbrecher saw as a retrograde war over standards. Because Europe in general lagged far behind the United States in adopting analog cellular technology, the EEC had sponsored a multinational drive to leapfrog the United States by adopting a digital standard, which could then be exported to America. The standard they chose was called GSM (global services mobile), a time-division multiple-access (TDMA) scheme that exceeded analog capacity by breaking each channel into three digital time slots. Racing to catch up, the American industry adopted a similar TDMA approach that also increased the current system's capacity by a factor of three. With McCaw Cellular in the lead, American firms quickly committed themselves to deploy TDMA as soon as possible.

Then in 1991, Qualcomm unleashed a bombshell Exploiting the increasing power of DSPs to process digital codes, the company demonstrated a spread-spectrum, code-division multiple-access (CDMA) modulation scheme that not only increased capacity some twentyfold over analog but also allowed use of the entire 11.5 megahertz of the cellular bandwidth in every cell. To prevent interference between adjoining cells, analog and TDMA systems could use a frequency in only one cell out of seven.

Much of the industry seemed paralyzed by fear of choosing the wrong system. To Shute and Steinbrecher, however, these fears seemed entirely reckless. Using wideband digital radios, companies could accommodate any array of frequencies and modulation schemes they desired TDMA, CDMA, voice, data and eventually even video. Shute resolved to adapt Steinbrecher's advanced radio technology to these new markets. In mid-1991, Shute rushed ahead with a program to create a prototype cellular transceiver that could process all 12.5 megahertz of the cellular bandwidth and convert it to a digital bit stream.

The first major customer for the radios turned out to be ADC-Kentrox, a designer of analog cell extenders designed to overcome "dead zones" caused by large buildings in urban areas. This system was limited in reach to the few hundred meters the signals could be sent over analog wires without deterioration. By converting the

signals to digital at the remote site, the Steinbrecher radio extended this distance from hundreds of meters to scores of kilometers and allowed the price of the product to remain at $ 100,000.

But these gains concealed the potential impact and meaning of the Steinbrecher technology. Once again, the Steinbrecher radios are being used to complement the existing system rather than overthrow it. In a similar way, McCaw plans to buy some $ 30 million worth of Steinbrecher machines to carry through its cellular digital packet data (CDPD) network. To be provided to 95 percent of McCaw's regions by the end of 1995, CDPD is a data overlay of the existing cellular system, which allows users of the current analog system to send digital data at a rate of 19.2 kilobits per second, compared to the 9.6-kilobit-per-second rate offered by most modems over twisted-pair wires.

The Steinbrecher radio can survey any existing swath of spectrum in real time and determine almost instantly which channels are in use and which are free. It is this capability that convinced McCaw to buy Steinbrecher data cells despite the commitment of McCaw's putative owner, AT&T, to sell narrowband units made by Cirrus Logics' subsidiary Pacific Communications Sciences Inc. (PCSI), which have to scan through channels one at a time. McCaw is using the Steinbrecher radios as sniffers that constantly survey the cellular band and direct data bursts to those channels that are not being used at a particular time.

Indeed, the immediate needs of the marketplace alone justify the adoption of Steinbrecher data cells. With modems and antennas increasingly available and even moving sometime next year to PCMCIA slots the size of a credit card, demand for wireless data is likely to soar.

PCSI is now shipping a quintuple-threat communicator that fits into the floppy bay of an advanced IBM ThinkPad notebook or an Apple PowerBook, enabling them to send and receive faxes, make wireless or wire-line phone calls, dispatch data files across the existing cellular network or send CDPD packets at 19.2 kilobits per second. Speech recognition capabilities from IBM and Dragon Systems will come next year to personal digital assistants, permitting them to read or receive E-mail by voice. Although the first Newtons and Zoomers have disappointed their sponsors, the market will ignite over the next two years as vendors adopt the essential form factor of a digital cellular phone with computer functions rather than providing a kluge computer with a vaporware phone.

Nonetheless, McCaw has more on its mind with Steinbrecher than merely gaining a second source for CDPD sniffers. By simultaneously purchasing some 10 percent of the company and putting chief technical officer Nicholas Kauser on the Steinbrecher board, McCaw is signaling not a tactical move but a major strategic thrust. The Steinbrecher rollout in fact represents McCaw's stealth deployment of broadband

digital capability.

Today the rival CDPD equipment from PCSI, Hughes and AT&T all can be made to perform CDPD communications as an overly to the existing cellular phone system. However, only the Steinbrecher systems can be upgraded to perform all of the functions of a base station and more, for voice, data and video. Only Steinbrecher allows the replacement of 416 radio transceivers, one for each channel, with one broadband radio and some digital signal processing chips. Only Steinbrecher can replace a $ 1.5 million, 1,000 square foot cellular base station with a box the size of a briefcase costing some $ 100,000 but, thanks to Moore's Law, racing toward $ 10,000.

It remains to be seen only whether McCaw will have the guts to follow through on this initiative by completely rebuilding its network to accommodate the wideband radio being installed at its heart. Self-cannibalization is the rule of success in information technology. Intel and Microsoft, for example, lead the way in constantly attacking their own products. But this mode of life is deeply alien to the telephone business -- even an entrepreneurial outfit like McCaw.

With new software and a simple upgrade to a MiniCell, the Steinbrecher DataCell will allow the McCaw system to handle all modulation schemes simultaneously -- AMPS, TDMA, CDMA and future methods such as Orthogonal Frequency Division Multiple Access -- obviating the need for hybrid phones. The multiprotocol and aerobatic capabilities of broadband digital radios could enable McCaw to roll out a cornucopia of PCS services -- for everything from monitoring vending machines or remote power stations to tracking tracks and packages, and linking laptops and PDAs -- while the rest of the industry is still paralyzed by wrangles over incumbent users, regulatory procedures, frequency access and radio standards.

Making channel sizes a variable rather than a fixed function of radios, Steinbrecher systems offer the possibility of bandwidth on demand. They could open up the entire spectrum as one gigantic broadband pipe into which we would be able to insert packets in any empty space -- dark fiber in the air.

So Stop The Auction

So what does this have to do with the impending spectrum auction? Almost everything. Strictly speaking, the FCC is leasing 10 year exclusive rights to radiate electromagnetic waves at certain frequencies to deliver PCS. This entire auction concept is tied to thousands of exclusive frequency licenses. It has no place for broadband radios that treat all frequencies alike and offer bandwidth on demand. It has no place for modulation schemes that do not need exclusive spectrum space. Continuing to use interference standards based on analog transmissions that are affected by every passing spray of radiation, FCC rules fail to grasp the far more robust nature of digital on-off codes with error correction. By the time the FCC gets

around to selling its 1,500 shards of air, the air will have been radically changed by new technology.

The FCC is fostering a real estate paradigm for the spectrum. You buy or lease spectrum as you would a spread of land. Once you have your license, you can use it any way you want as long as you don't unduly disturb the neighbors. You rent a stretch of beach and build a wall.

The Steinbrecher system, by contrast, suggests a model not of a beach but of an ocean. You can no more lease electromagnetic waves than you can lease ocean waves. Enabled by new technology, this new model is suitable for an information superhighway in the sky. You can use the spectrum as much as you want as long as you don't collide with anyone else or pollute it with high-powered noise or other nuisances.

In the Steinbrecher model, you employ the spectrum as you use any public right of way. You are responsible for keeping your eyes open and avoiding others. You cannot just buy a 10 year lease and then barge blindly all over the air in a high-powered vessel, depending on the government to keep everyone else off your territory and out of your way. The spectrum is no longer dark. The Steinbrecher broadband radio supplies you with lights as you travel the information superhighway. You can see other travelers and avoid them.

Even if Steinbrecher radios did not exist, however, the assumptions of the auction are collapsing in the face of innovations by Qualcomm and other spread-spectrum companies. Like Steinbrecher radios, CDMA modulation schemes allow you to use spectrum without interfering with others. To auditors without the code, calls seem indistinguishable from noise. But radios with the code can dig up signals from under the noise floor. Up to the point of traffic congestion where the quality of the signal begins to degrade gracefully, numerous users can employ the same frequencies at the same time.

This property of CDMA has been tested in Qualcomm's CDMA Omnitracs position locator and two-way communications system. Mainly used by trucking companies, it is now being extended to cars, boats, trains and other mobile equipment. Based on geosynchronous satellites, it operates all across the country, with some 60,000 units, under a secondary license that forbids Qualcomm to interfere with the primary license-holders of the same frequencies. Qualcomm's transceivers on the tops of trucks use a small antenna that issues a beam six to 10 degrees in width. Because satellites are just two degrees apart, the Qualcomm beam can blanket several satellites. Other users, however, are entirely unconscious of the presence of the CDMA signal. Omnitracs has operated for some six years and has not interfered with anyone yet.

No More Blind Drivers On The Information Superhighway

With an increasing array of low-interference technologies available, the FCC should not give exclusive rights to anyone. Instead, it should impose a heavy burden of proof on any service providers with blind or high-powered systems that maintain that they cannot operate without an exclusive license, that want to build on the beach and keep everyone else out of the surf. In particular, the FCC should make all the proponents of TDMA, whether in the American or European GSM systems, explain why the government should wall off spectrum. The wireless systems of the future will offer bandwidth on demand and send their packets wherever there is room.

At the same time that new technologies make hash of the need to auction off exclusive licenses, Qualcomm and Steinbrecher also radically attack the very notion of spectrum scarcity on which the auction is based. Steinbrecher's radio makes it possible to manufacture new spectrum nearly at will. By putting one of his MiniCells on every telephone pole and down every alley and in every elevator shaft, the cellular industry can exponentially multiply the total number of calls it can handle. At some $ 100,000 apiece and dropping in price, these MiniCells can operate at 900 megahertz or six gigahertz just as well as at the two-gigahertz range being auctioned by the government. It is as if Reed Hundt is auctioning off beachfront property, with a long list of codicils and regulations and restrictive covenants, while the tide pours in around him and creates new surf everywhere.

Still more important in view of the coming auction, the wideband capability of the Steinbrecher radio joins CDMA in allowing the use of huge spans of spectrum that are ostensibly occupied by other users. The Steinbrecher radio can survey the gigahertz reserves of the military and intelligence services, UHF television and microwave, and direct usage to the many fallow regions. For example, the prime territory between 225 megahertz and 400 megahertz, consisting of some 3,0130 25-kilohertz channels, is entirely occupied by government and air force communications. But most of the channels are largely unused. A Steinbrecher radio could sit on those frequencies and direct calls to empty slots.

An ideal system would combine Steinbrecher broadband machines with Qualcomm's modulation schemes. Steinbrecher supplies the lights and eyes to find space in already licensed spectrum bands; CDMA allows the noninvasive entry Into spans of spectrum that are in active use.

Meanwhile, the Steinbrecher system changes the very nature of spectrum "ownership" or rental. Unrestricted to a single band or range of frequencies, Steinbrecher radios can reach from the kilohertz to the high gigahertz and go to any unoccupied territory. As Steinbrecher radios become the dominant technology, the notion of spectrum assignments allotted in 2,500 specific shards becomes a technological absurdity.

Wall Street is beginning to catch on. When Steinbrecher announced in January a private placement through Alex. Brown, the

company wanted to raise some $ 20 million. The response was overwhelming, and hundreds of frustrated Investors were left wringing their hands as the new radio left the station. The sole proprietorship of the mid-1980s with revenues of $ 5 million or less was moving into sleek new headquarters off Route 198 in Burlington. Steinbrecher Corp. was becoming yet another of the Moore's Law monsters.

Meanwhile, the issue for Washington emerges starkly. Do we want a strategy for MiniCells or for Minitels?

Channel 83 -- 157.175 -- is another CG favorite in the Los Angeles area.

In L.A. the CG also has a "tactical" frequency of 162.125 that is not typically available on VHF marine radios. They sometimes use encryption on that freq.

Also in L.A., maybe elsewhere, helo operations may be monitored on 237.9, 381.7 and 381.8, all in AM.

: mind having the 1500, but have heard some bad things about it like
: intermod troubles, insensitivity, and, is there a lot to listen to on SSB
: and good enough selectivity below 30 MHZ? It couldn't be worse than my
: Pro2022 I used to have... Should I just get the 1000 and the not much
: better sensitivity for just $40 less? The Pro43 is the best for its price
: range, but it isn't continous coverage or as rangy as the AORs. I am a new
: ham that hasn't much been interested in operating telephone but would like
: an HT that could do double duty as an occasional scanner, but I know I
: will be sacrificing a lot of things like selectivity and step increments.
: Any one I choose, I'll be doing something stupid anyway if the scanning
: hobby is killed by digital...

I have an AR100, and it is a good radio but a pain in the rear to
program. I read that the Ar1500 is worse. I also have a Pro-37 (the 43
uses the same controls) and it is easy to use and program. I think that
the gaps in the 43 are mainly TV signals. The only proboem with the 43
is finding someone to restore full 800 coverage! On SSB, I find that
the 1000 does not pick up < 30 mhz as well as a SW receiver, so I wonder
if SSB for this range would be worth the price?

Good luck.

I assume you already know that the Pro-2006 can receive many more frequencies, and what those additional bands are for. Is there anything of interest to you on these bands?
What are the laws concerning scanners in Brasil? Here in Florida it is illegal to have a scanner mounted in your vehicle, but it's perfectly okay to have one, let's say, laying on your seat.
Are you interested in doing modifications to your scanner? You can do these to both scanners, but space for many more in the Pro-2006.
Will you be in noisy situations? If so, you'll need to wear ear-phones to listen to the Pro-43, because it's got a tiny speaker.
Confused? No problem. Do like I did and get both! Call Marymac Industries at (800) 231-3680 and ask their prices, compared to the catalog (and even sale) prices of local Radio Shack's.

I'll suggest what I use for my scanner with a belt clip, a book
end. Yes, a book end. Bend the back of it back in the
direction of the long (under book) tongue, then either put glued
rubber feet on it (I'd suggest 3) or some hot melt glue or
silicon sealer on the bottom then just drop your unit onto the
new stand. Very stable and $1.50 in single prices. :)

Buy Howard Bornstein's "Guide to the AR1000"; I don't have his address handy but he advertises every month in the back of Monitoring Times under the company name Design Equilibrium.

It is **THE** book for this radio, period.

I've been lurking here for awhile to find out a bit about scanners.
I'm a railfan and have been considering getting a scanner, but I need
to a little more before buying one.

For my intended purposes, I know I need the following:

- a portable unit
- the ability to scan railroad frequencies (160-170MHz)
- the ability to program in banks of frequencies that can
be enabled and disabled as needed (for example, one bank
would have the frequencies used in a particular location
by a particular railroad)

What I am not sure about other characteristics, such as scan rate.
What is recommended?

I spoke with a salesman at a Radio Shack store (realizing that I
may not get the answers I need) and was told that all their scanners
with more than 10 channels could be programmed in banks of 10. Is
this true?

One further question, I came across a used PRO-35 scanner for
$150 (Canadian). Would this model be suitable for my purposes and
is this a good price?

Hello all,

While watching TV last night in the Dallas area, I noticed a news article involving a metal building contractor who was taking people's downpayments and not providing any service. During the course of the article a certain man who had been scammed was being interviewed. He talked about monitoring the contractor's radio system and providing incriminating evidence from the recordings he had made. While this is all kind o neat from a scanner nerd perspective, I noticed his pro2006 had a line of LED's up the center crevis which ramped with signal input! Now thats really neat! Does anyone know about a published mod for this application? I've checked the usuall places and don't see anything relative to this mod.

Thanks for any help.

-Brad

Might be transformer hum. A quick fix is to buy one of those power converters at Radio Shack (the AC to DC ones) and plugging it into the DC jack on your 2006. The transformer won't hum because there's no power running though it and your 2006 will run cooler too. Or so that's what I've heard...

Fair point. Amateur organizations represent marginal
interests in the eyes of the general public.
So, de facto, their privileges exist at the pleasure of the regulatory agency.
An unenviable choice:
1. Be an NRA-style gadfly, and get bashed regularly.
2. Become complicit with the agency, to maintain some rights
that the agency deems harmless.

Cheers to those who spoke out on the Illinois ban,
and got its author to rethink the implications.

3455. Pro43 HELP

Newsgroup: rec.radio.scanner
Date: 1994-05-05 15:40:02 UTC
From: reider@acrux.GSFC.NASA.GOV
Message-ID: <2qb40i$p6u@paperboy.gsfc.nasa.gov>
Source record: 274704

Real quick question, while removing the boards
on my 43 I cut the antenna wire and no longer
have it. I replaced the wire with a piece of
braided electrical wire. Will this cause
reception loss ? if so, what type of wire
(gauge ....) is best to use from the antenna to
the board??
The piece of wire I used was only about 1 inch long.

By the way, the speaker also went out a few days
ago and I had to by a new one, (I here this is a
known problem)

3456. Scanners forsale (2)

Newsgroup: rec.radio.scanner
Date: 1994-05-05 15:49:06 UTC

I have 2 scanners for sale

Here's the stats

Desk Model Pro 2028
New as of 1/1/94
$90
50 channels
29-54
108-136.975
137-174
406-512

Handheld Model Pro 38
10 channels
$50
29-54
136-174
406-512

I will pay shipping and handling charges on any scanner.

They all receive fire,police,rescue,cordless phones.

You can call me at work (301) -286-6457 Richard

From: msaran@pt.olympus.net
Message-ID: <2qbaom$4fe@olympus.net>
Source record: 274716

I have a 2004 with all the bells and whistles. The mod was done by Lester Jurnigan (sp?) at Lescomm. His address (1990) was P.O. box 5212 Jacksonville, AK 72076. Lester put in a vertical yellow LED signal meter, that may be what you are describing. He also installed a pre-amp and faster scan/search speed. BTW the faster scan mod also caused a loud hum with the light on high - on low the hum is very low.

Motorola has a new line of cordless "flip phones" that have a security feature. The demonstration kiosk has a button you can push to hear what the phone sounds like to someone using a scanner to listen in. It sounds terrible. You can't hear anything. Price is around $200.

This is a repost with a lower price. Uniden Bearcat BC8500 500 channel scanner for sale. In very good condition, used very little, just don't listen to it enough to justify such an expensive scanner. I have the box, manual, etc. I want $275 plus shipping or trade for a used 2 meter rig plus or minus cash, depending on the rig. I might be interested in other trades, what have you?

Perhaps if there had been some amateur radio relevance to the scanner ban
the ARRL would have objected. Since amateur radio can go on doing its thing
without the ability to monitor cellular phones I don't see the relevance.

You may want to check out the Icom IC-2SRA. It has a 2m radio with all the bells and whistles, PLUS a wide band scanner built in 25 - 950 MHz CONTINUOUS coverage AM,FM,WFM with all the correct step sizes. It's not the perfect scanner, but its the best available on a ham HT.

3466. Info on DTMF/PL decoders

Newsgroup: rec.radio.scanner
Date: 1994-05-05 22:35:13 UTC
From: brett_miller@ccm.hf.intel.com
Message-ID: <brett_miller.189.001696EF@ccm.hf.intel.com>
Source record: 274658

I wrote this almost a year ago for the BASE newsletter. I've been meaning
to post it here for a while. Sorry if any of the data is dated now.

DECODERS FOR YOUR SCANNER

I thought I would pass along some of the information I have
gathered in my search for a Tone/Code decoder for my scanner.

Decoders for HF radios have been around for a long time. There
is a wide rage of non-voice signals on HF, like FAX, RTTY,
Packet, etc. With a multi-mode decoder, you can decode these
signals and display them on your computer screen or printer.

Decoders (AKA: tone readers) for VHF/UHF scanners are relatively
new accessories for the scanner buff. Most VHF decoders now
available cover three modes: CTCSS, DCS and, DTMF.

CTCSS (Continuous Tone Code Squelch System)- This mode is also
know as PL, which is Motorola's trade name: Private Line. CTCSS
is a Sub-audible tone that is transmitted with the radio signal.
There are 50 different tones in use. For example, the tone of
131.8 means that a 131.8 Hz tone signal is also sent with
whatever is being transmitted. The receiving radio will only
open its squelch if it detects the tone it is set to. CTCSS is
used extensively in public service and business communication
systems.

DCS (Digital Code Squelch)- Also known as DPL. This is used for
the same purpose as CTCSS but using digital codes. There are 104
different DCS codes used. I don't know what these signals sound
like so I don't know if they are in use locally.

DTMF (Dual Tone Multiple Frequency)- These are the common
Touchtones used on your telephone. There are 16 DTMF tones.

WHY BUY A DECODER?
There are many reasons a decoder could come in handy. If you the
know the CTCSS tone(s) used on a particular frequency and you
have a directory that lists the tones used, you will be able to
determine who is transmitting. This is particularly useful when
multiple groups share a single frequency. If you have a radio
that also has CTCSS capabilities, you can set the tone to match
the agency you wish to monitor so you will only hear the desired
agency. Using tone squelch on your receiver is also a great way
to eliminate noise and intermodulation (the M-400 can do this
with any radio). Remember that some repeaters use one tone on

the input, and another on the output. HAMs can also determine CTCSS tones used in order to access repeaters.

Decoding DTMF tones is a bit less benign. DTMF codes are used to program and access special features on repeaters and other equipment. CDF has a repeater that will give a full weather report if the correct DTMF codes are entered. Cellular and some cordless phones send out DTMF numbers as they dial or access voice mail. DTMF codes are also used in some HAM equipment for paging functions.

Author's Note: Please do not tarnish the image of scanner enthusiasts by using decoders irresponsibly. The information gained by the use of a decoder should not be used for illegal purposes. Scanner buffs do not need more bad PR.

AVAILABLE DECODERS
The following information has been compiled from magazine ads and sales literature. (compiled 11/93)

1. CSI model: CD-1, Price: $200, No printer or computer ports, Modes: CTCSS, DCS, DTMF, Display: 4 digit LED
Memory: Re-display of last item received

2. Universal model: M-400, Price: $400, parallel port, VHF Modes: CTCSS (41 standard tones), DCS, DTMF, POCSAG, GOLAY, (POCSAG & GOLAY are for digital pager signals), ACARS (Aircraft Communications Addressing and Reporting System)
HF Modes: Baudot, Sitor A & B, FEC-A, ASCII, SWED-ARQ, FAX
Display: 2 x 20 LCD, Memory: 4000 character scrollable
Also has PL/DCS/DTMF squelched speaker output. Made by Digital Electronic Systems.

3. Optoelectronics model: DC440, Price: $260, serial I/O (2.5 mm stereo plug with TTL level. Converter is an $89 option)
Modes: CTCSS, DCS, DTMF, Display: 2 x 16 digit LCD w/backlight, Memory: 63 DTMF digits & most recent PL tone
This unit is fully software controllable, however, at this time you'll have to write your own program. It will work with standard communication (modem) software. A radio control program called Scan Star can interface with this unit to add PL tones to its logging file.

4. Motron Tone Master, Price: $240, ($169 w/o serial interface)
Serial Port, Modes: DTMF only, Display: 16 digit LCD
Memory: 80 character scrollable

5. AIE model: TCF series:
TCF-3 Price: $300, Serial Port, Modes: DCS, CTCSS, Display: 3 digit LED, Memory: Optional
TCF-4 Price: $330, (this unit is an add-on CTCSS/DCS squelch for the R.S. Pro-2004/5/6 series, or 760xlt)
TCF-5MRTC Price: $440, serial port, Modes: CTCSS, DCS, DTMF,

Display: 16 digit LCD, Memory: 297 digit Also has DTMF
activated alarm. (MRTC=Memory, Real Time Clock)

From: sgbradley@aol.com
Message-ID: <2qbuhu$fh4@search01.news.aol.com>
Source record: 274719

Since form FCC 740 is for ANY type of non certified device, and since the U.S. customs only interest is seeing that the form accompanies any NON-CERTIFIED device, who or what will stop the importation of scanners?

The FCC has opening admitted they do NOT have a listing of non-certified scanners, and the U.S. Customs are NOT experts in RF generating devices.

I think its called scare tactics. Does anyone know of anyone who has either TRIED to import and was not successful, or actually was successful?

Since the U.S. Customs only interest is the appropriate documentation, I'd say keep ordering overseas and ignore the FCC rules. If I wanted an MVT 7100, I'd go ahead with no second thoughts. To the customs, a "cpu-locked out" MVT-7100 is no different than a "full coverage" MVT-7100, since neither are FCC certified. If the form is there, it passes. BTW, does anyone know if Javiation quit selling overseas? I'd hate to think the business is going to the Canadians and Germans! What about Nevada Radio in the U.K? Do they import?

The rules do NOT read "you are no longer permitted to import non-certified devices" does it? Do you think customs will know the difference between the units? I'd doubt it!

Personally I have no problem, I have enough friends who come and go on business I could easily get them to do me a favor (I could actually get one from Javiation even if he was not willing to ship it here!). But, I am in a metro area rapidly switching to 800 mhz and without an on/off switch on the delay per channel it would be useless to me.

Comments anyone? Since U.S. Customs requires only the form. They have no listing of what is ok vs not ok, and do not have the expertise to "certify" (since that is the job of the FCC and these are UNcertified devices), who's going to stop it arriving?

You tell me? I could be a businessman ordering a shortwave portable for business. I could be a lawyer who could sue them with damages for no public listing available of which models are not permitted. I hope someone does sue them... enough they will not carry out this stupidity again.

Steven

3470. Re: What to buy before April Cutoff -- Huh???

Newsgroup: rec.radio.scanner
Date: 1994-05-05 23:22:02 UTC
From: sgbradley@aol.com
Message-ID: <2qbv2q$fk8@search01.news.aol.com>
Source record: 274720

Simple...

Use FCC form 740. Import for personal use as non-certified devices. Declare them as radio receivers for customs purposes.

U.S. Customs are not RF specialists. They can not determine the level of how modifiable a scanner is or is not. They do not know the difference between one that is locked out in the CPU, locked out by a semiconductor change, or not locked out at all. There is no listing since they are not certified. All they look for is the form. They can not determine if a scanner complies or not, that is the job of the FCC. Since these are non certified devices, they do not have certification and for personal use in small quanitities, there is no need to certify them.

Therefore there is nothing to stop you from importing them. Someone needs to call U.S. Customs and speak to them... and then post the results here. They are paper-pushers, not technical analysts! Speaking of U.S. customs, I am blessed to being within range of their new communications headquarters in Orlando, FL. They have requested use of the Naval Training facilities which the government no longer sees a need for. This could make good listening if they do get educated... (as in duh, this is anuther un of them MVT thingies, is it hokay?)

What I am waiting to see is the overseas companies start selling the modification plans and CPU chips, PROMs, or whatever the international versions use (where they are not locked out in the CPU etc) and shipping them over here. The FCC can not regulate the chips and raw materials being shipped over!

Steven

Message-ID: <2qc1n7$g5c@search01.news.aol.com>
Source record: 274722

Well do not let the FCC law scare you... Go ahead and order it anyhow.

There are NO export restrictions from Canada, UK, or Germany on these communication receivers. The U.S. Customs are NOT technical analysts. They only need form FCC 740 completed with the unit to let it pass.

FCC form 740 is usable with ANY non certified device. That includes the MVT 7100.

Go ahead and order ... and enjoy! :)

Steven

3476. BC100xlt Mods?

Newsgroup: rec.radio.scanner
Date: 1994-05-06 01:46:19 UTC
From: kspain@huey.cc.utexas.edu
Message-ID: <2qc7hb$ab3@huey.cc.utexas.edu>
Source record: 274625

Does anyone have or know where I can get mods (especially cellular) for
the BC100xlt? I've checked rigel.oakland.edu but have found nothing.
Is this unit even modifiable?

Thanks.

Kevin

3477. Re: Where are the Yupis?

In a previous article, sgbradley@aol.com (SGBradley) says:

>Well do not let the FCC law scare you... Go ahead and order it anyhow.
>
>There are NO export restrictions from Canada, UK, or Germany on these
>communication receivers. The U.S. Customs are NOT technical analysts. They
>only need form FCC 740 completed with the unit to let it pass.
>
>FCC form 740 is usable with ANY non certified device. That includes the MVT
>7100.
>
>Go ahead and order ... and enjoy! :)

I have posted several times concerning buying Yupis from Lorenz Radio in Montreal only because I've dealt with them as a satisfied customer and their price is good..and are closer than Javation in England. And I guess I feel sorry for you Yanks <grin>. Funny enough, Herbert Lorenz was telling me today that orders for the Yupi seemed to have dried up. He was not aware of "that law" down south.

They are quite willing to continue shipping but obviously will not guarentee delivery passed customs. I might suggest to those willing to try importation, to request that the receiver kit be shipped separately from the owners manual. The manual does state 800 coverage and although is badly written, might tip off your customs people.

Just a tip from someone living in the True North Strong and (still) FREE!

Howdy all,
I recently was delighted to pick up a MVT 7000 from
someone who went over to England. The main problem is that
I am having a lot of problems trying to program the thing!
I read the instructions and when I go to repeat the steps,
it beeps at me like I'm an idiot! I don't know, maybe I am,
I've had other scanners before and have never had the roblems
of programming them. Am I doing something wrong? My friend
told me that they checked it out and made sure it worked before
he brought it back to the states, it even had some freqs. programmed
in, unfortunately, nothing I can use. Anyone who can help me I would
very much like to hear from you!

Thanx in advance!

3479. Re: Scanning Trunked Syst

Newsgroup: rec.radio.scanner
Date: 1994-05-06 02:53:00 UTC
From: john.tant@exchange.com
Message-ID: <2d.6015.603.0N850299@exchange.com>
Source record: 274628

Scanning trunked systems can be a little touchy if you're in one of those cities where they leave a little song on the channel they leave. Corpus Christi has such a system. It's put out by GE and plays the "bring good things to life" jingle as it leaves a channel. This is to keep scanners locked on that channel. To listen, you have to keep your finger on the scan button, typically using two scanners.
Unfortunately, the days of being able to listen in and stay out of their way are just about over. I enjoy using the scanner because it helps me to avoid areas congested due to accidents while I drive. Most places don't have daytime traffic reports. Someone commented earlier that if you want traffic info, listen to commercial radio. I don't know about his town, but many of the info providers in this town get their info via scanners.

John

>>
>Perhaps if there had been some amateur radio relevance to the scanner ban
>the ARRL would have objected. Since amateur radio can go on doing its thing
>without the ability to monitor cellular phones I don't see the relevance.
>--

Point one:
There is no relevance to amateur radio, why did the feds even think they
should ask them? Why did they believe the ARRL even came any where near
having a valid opinion on the subject? The answer is because the ARRL
guys are believed to represent radio hobbyists in the US which is totally
false. The hams usually couldn't care less about scanners and the like.

Point two:
If the original poster's comments were correct about *all of* the 800
and 900mhz bands being deleted from the new "legal to import" Icom
R7100, then the Hams just lost the ability to monitor the 900mhz band.
Yes, Icom did not need to eliminate anything other than cell bands,
but they must have felt that it was somehow better to play it safe
and eliminate anything that could be even close to the cell bands. Why?
Maybe they were worried about images popping up or something like that
(Remember the fuss in NJ about the double conversion R/S scanners
being declared illegal to sell?). So did Icom eliminate 800-1000MHZ
from the R7100 or not?

The point in all of this is that the ARRL does not represent the
interests of scanner listeners, their opinions are not relevant,
and the government had no business attaching any sort of relevance
to anything they had to say about the proposed (now law) legislation.

We as scanner hobbyists, deserve what we got for not having an organized
lobby to fight for our interests. It is getting so you have to be a member
of several organizations just to prevent (or at least slow down) this continual erosion of
our rights and privileges! Maybe Australia is a better place.....

Hey you chaps down under, can you own assault weapons down there? How about
wideband radios? Do you have silly laws like we yanks do in these areas?

That is about right as far as the batteries go. I also have this radio and have had to change batteries in the set after 2 weeks of continuous scanning in the alert mode. I have never had the set go off but it is quite sensitive and even with the antena down the local station on 162.4 comes in loud and clear. I wish they had put a power jack on the set though. I did buy the set for it's alert feature but changing batteries every 2 weeks can get rather expensive. I am thinking of buying a couple of set

s of rechargeables for it. Is anyone reading using rechargeables in this radio and how well do they seem to work?

djc@terapin.com Out!

The Icom memo I saw a few months ago said they were deleting the 800-900 band just so they won't have to redesign the radios. If we don't buy anymore Icom's they should get the idea, if they want to sell radio's they will need to delete cellular only, not the whole band.
Most hams don't care about scanners? Most hams I know have scanners, many of them in fact. I guess I missed your point on that one?
L.B.

I've been to Sao Paulo often and yes its a big city. I own both a Pro43
and a Pro2006. I bought the Pro43 first and found that the portability was
essential. The followup to the Pro2600 was a choice I made mostly because
of sound quality for use at home. I would recommend the handheld first
then moving on if you feel the need. Good Luck!

: >may not like the NRA, but at least they take the position of no further
: >restictions, period when it comes to their area of interest.
: >We have no such organization to represent and lobby for our interests

: Fair point. Amateur organizations represent marginal
: interests in the eyes of the general public.
: So, de facto, their privileges exist at the pleasure of the regulatory agency.
: An unenviable choice:
: 1. Be an NRA-style gadfly, and get bashed regularly.
: 2. Become complicit with the agency, to maintain some rights
: that the agency deems harmless.

: Cheers to those who spoke out on the Illinois ban,
: and got its author to rethink the implications.

I work for ARRL. My title is Assistant Technical Editor. I
edit articles for QST and write one once in a while. I'd
like this posting to be accepted as the views of a member,
rather than as an employee. If you think I'm speaking as an
employee, you won't take what I'm saying as seriously.

I don't think it's appropriate to attack ARRL because of the
actions of the cellular telephone industry. I'm not aware of any
scanner groups coming forward to defend Amateur Radio for any
reason in the past. And, so far, no one has persuaded me that:

1. ARRL, an organization that represents licensed radio
amateurs in the United States, had any business sticking
its nose into this affair, unless asked.

2. The ban in any way affects the operation of US hams, which
is essentially what ARRL told FCC.

Someone will probably try the construction "Today cellular,
tomorrow all frequencies will be banned," or some such, as a
reason for ARRL to become involved.

You'll recall that FCC did not unilaterally propose this ban.
FCC was DIRECTED to do so by Congress, so FCC came up with
regulations it felt met the criteria Congress established.

Probably no one in FCC wanted this law. I know of no one at ARRL who wanted it. Nonetheless, there it is, an accomplished fact. To lie and say it somehow affects ham radio would have done nothing for anybody.

While it is possible that some national police organization, for example, may lobby congress to ban scanners capable of picking up police transmissions, it's probably safe to say that the cellular industry couldn't care less what we listen to, other than cellular telephone conversations. So we've probably seen the last of the bans.

Now I'm really going to walk out on the limb. While NRA members are constantly victimized by the actions of criminals who use firearms, scanner users are often their own worst enemies. This newsgroup is available to anyone with a terminal and a modem, yet one frequently reads braggadocio here about calls overheard. One reader gleefully described a "practical joke" he and a friend played on someone whose cordless phone call to a phone sex telephone service they overheard.

A little responsibility on the part of scanner owners might have prevented this ban. Yes, it was unfair to punish the many for the actions of the few; yes, the ban is silly, and anyone can continue to listen at will; yes, cellular calls are inherently insecure. But if some scanner owners hadn't felt compelled to go public with the fruits of their listening, we might not have had the trouble in the first place.

There's a big difference between self restraint and external censorship but, lacking the first, the second often follows. I see a lot of griping on this newsgroup about what "should" have happened, but when the previously mentioned bragging was going on (there was even a thread dedicated to the subject), the voices of reason were strangely silent. I guess it depends on whose ox is being gored. And yes, I did try, publicly and privately, to persuade posters of the folly of such revelations.

Good listening.

>in, unfortunately, nothing I can use. Anyone who can help me I would
>very much like to hear from you!

How far have you got ?

To set to 123.75Mhz, AM.

1. Press 123.75
2. Press ENTER
3. You might need to change to AM so press FUNC + AM (1 key)

To change modes press FUNC+(1), (2) or (3). To change the
increnment step size just press the STEP key and it will scroll
thorugh the alternative steps.

Thats it.

To store in a channel press the channel number then
FUNC+MEM.WRITE.
You will get a bouble beep and the channel will quickly show to
the left of the frequency.

E-mail me if you are stil having trouble.

I'm interested in the BC2500 but the mod file says that there are 2 versions
and that the mod is only valid for 1 of those. Does anyone know how the
heck you can tell the differnce when you are buying? Is there a new mod
out that I don't know about that covers the second version?

Thanks for the advice. I got a couple of helpful e-mail messages, too, and the choice is clear--I just ordered the Pro-2006 from Marymac (800-231-3680). They have modifiable 2006's in stock going for $345. That includes a one year warranty. No sales tax on out-of-state shipments (I think they're in Texas).

I hope my wife approves!

In 1993, approximately 80 people were killed with so called Assault Weapons.
In that same year approximately 300 people were killed by bee stings.
These statistics cover the United States and the 80 number is an annualized
figure derived from the Justice Department and quoted by Dianne Feinstein.

> One of the featuress of the ASTRO radios is the ability to
> encrypt correct?
Yes, encryption is optionally available on Astro radios, but is not required for non-encrypted FDM digital operation.

> SECURENET is a different type of encryption and is an
> optional feature for the ASTRO correct?
Securenet is the product line name for the older line of 12 KB encrypted radios by Motorola. Commercial securenet radios can use DVP, DES, and DVI encryption and the extended range "XL" versions of these.
To try to confuse you just a bit more....Astro radios can also be used in the 12 Kb Securenet mode to ease transition from Securenet to Astro systems.

> So is it correct to say that
> Motorola has two encryption methods, one built into the ASTRO and one that
> can be bought as an option (SECURNET)?
No, See above.

> If these are two different encryption methods (ASTRO/SECURENET) which is
> tougher to break? Or are they the same?
Astro is a 9.6 Kbs product using a VSELP or IMBE vocoder. Securenet is a 12 Kbs product using a CVSD vocoder. The encryption is layered on top of this and is independent from the transmission method or rate or vocoder type.

> Motorola's add claims that
> there are so many possible codes that if you tried 1 million a second, it
> would take 75 million years to get thru them all. Does this number
> seem right?
Pretty close...

>If so, how was it calculated?
This is determined from the 71 bit key length. 2**71= 2.36118E+21 possible keys
/ 365 days/yr 24 hr/day / 3600 Sec/hr /1E+6 codes/sec

=74.8726 Million years (So big deal.. We lost 127,400 years in rounding!)

> The add for the ASTRO says
> the radios have an encryption algorithm capacity of 2 algorithms per
> radio and 16 encryption keys per radio. What is this telling me?
You could have DES and DVP or DVP and DVI, etc. You can have 16 separate
keys in the radio to talk to a number of different agencies or individuals.

I was just catching up on some Compuserve messages last night and it looks like the first few Uniden 220's have shipped to California. Howard Bornstein (sp?) is going to post a review soon. Preliminary reports say it blows away the Pro-51in all respects. If I see Howard's review, I'll try to post it here unless someone else does it.

Go with the 2006. The importation/manufacture cutoff date was April 26, so
all that is left in the stores is stock-on-hand (or in the warehouse).

The 8500 is not a bad scanner, but in Provo/Orem you'll have intermod problems
from the pagers. Also I have not seen any mod yet to open cellular.

3506. Pro-2006 opinions anything better

Newsgroup: rec.radio.scanner
Date: 1994-05-06 21:10:53 UTC
From: habu@inca.gate.net
Message-ID: <2qebot$12l1@inca.gate.net>
Source record: 274655

I just bought a Pro43 and I am looking into buying a Pro2006. Will the Pro2006 give me much of an actual range advantage,I doubt I'll be able to mount an outdoor antenna. Is there a better base model available for under $500? Does anyone know if there is an improved model in the near future. My only reason for rushing into buying the Pro2006 is I would prefer full 800mhz coverage.

Thanks for any help
Mike

>of several organizations just to prevent (or at least slow down) this continual erosion of
our rights and privileges! Maybe Australia is a better place.....

Face it. To the "outside world" we are just peeping-toms. I don't think
there is a politician anywhere that would stand up to the activist groups to
defend our right to eavesdrop. I don't think there is an arguement that would
stand up in today's political environment that would justify our right to
monitor the airwaves. We have a major image problem (and I'm not talking
about RF images) that may be beyond repair. It is probably better that we
stay hidden. If it wasn't for all the publicity about our ability to monitor
cellular, this ban would have never happened.

Even some of my Ham friends think I'm strange for having all this monitoring
equipment. (I know my wife thinks I'm crazy).

Your kidding right? I can imagine how many wacks possesing a scanner
gets you over there :-)

Seriously someone told me that US troops were told if anything
happened while in Singapore to turn themselves into the nearest MP's
no matter what they were accused of. Supposenly the singapore police
have a bad reputation for beating confessions out of people.

Now can you imagine what they would do if they found a scanner on you.
I don't think it would be a good idea. Atleast I wouldn't do it :-)

3512. BEYOND POLICE CALL is out!

Newsgroup: rec.radio.scanner
Date: 1994-05-06 23:51:18 UTC
From: berling@alleg.edu
Message-ID: <2qel5m$ms1@mustang.alleg.edu>
Source record: 274531

I haven't seen anyone else post this, but surely someone knows

that the Beyond Police Call has been printed and is out. Got mine last night (9.95 + tax) and one volume covers entire country. Salesman at RS said that his store got them in on 5/3. If Meadville has 'em, someone else has to.
After perus

ing and checking several frequencies, it seems that the freq. data is not up to date or is incomplete. The main frequencies for Hersheypark aren't even listed, and the two that are posted are low-power, non-repeater stations. Who knows what's going on -- perhaps that's why they encourage you to write.
Overall, is interesting and full of "fun" frequencies. Ample listing of utility companies and schools (college security). I'd have to say that it was probably a decent buy.
Anyone else have comments?

: brain.oakley@chrysalis.com

The NEC does not specify whether you switch the primary or the secondary
of the transformer.

I suppose I should buy the service manual, to see how they have it set up.

Hello all

Well, today I did it.

I ordered a TR 2500 (total coverage 1-1300 MHz) scanner. Retail price (as advertised on back cover of Pop-Com, May issue) is 449S US (around 650$ CAN). I presently own a Pro-57.

Unfortunately, due to back-order and shipping delays, I'll have my new toy in about 2 weeks :((((

Does anyone own/know about/have any comments on the TR 2500 ? I would appreciate any information you may have. E-mail me or post if of general interest.

Susan

This week's Spectrum will feature the world of weather satellites. Our guest is Jeff Kelly. Jeff is an expert at weather satellite imagery. He will tell us how to demodulate and decode those exciting pictures from space. You can be your own meteorologist this week on Spectrum.

On Saturday May 14'th we will take a look at Digital Audio Broadcasting or DAB. This high-tech system of broadcasting is in the wings and should be here near the end of the century. A few systems have been proposed for dab and a standard hasn't been decided as of yet. Our guest will be Ted Schober. Ted has been on the leading edge in the world of DAB and will give us a look into the radio of the future.

--
Spectrum airs live Sunday at 0200 UTC (2200 EDT Saturday) on:

WWCR, 5810 KHz, Nashville, TN (World Wide)
WIFI, 1460 AM, Philadelphia, PA (Philadelphia Area)
KHNC, 1360 AM, Denver, CO (Denver Area)
Omega Radio Network, Galaxy III, X17, 5.8 MHz WIDE audio. (Satellite)

Spectrum is rebroadcast:

Sunday at 1500 EDT, on WIFI, 1460 AM, Philadelphia, PA (Philadelphia Area)

Source record: 274667

To some of you who feel that opening ours mouths and defending our priveledges
in amatuer radio may not be a good thing. And I am not beating up on any one
just trying to make a point on freedom of speach. I offer the following poem
from a novel by Julia
n Jay Savarin call Pale Flyer

"When the Nazis came for Communists,
I was silent.
I was not a Communist.
When they jailed the Social Democrats,
I was silent.
I was not a Social Democrat.
When they came for the Trade Unionist,
I was silent.
I was not a Trade Unionist.
and when they came for me,
there was no one left to protest...

The lines I would add...

When they came came for the gun owners.
I was silent.
I didn't own a gun.
When the came for Civil Right Activist,
I was silent.
I wasn't a civil rights activist.
When the taxes rose too high, and I was unhappy,
it was impossible to protest as no was there to protest with me
they had taken our rights and no one had given a dam before now.

The moral of this story is two things!
1.) In this county we are allowed to express our dislike about a certain
activity, and few people take the oppourtunity to do it!
2.) If you don't take a stand and let your opinion be known no one else will
hear your side of it, and if you wait too long it wmatter as no one will be
there to here you. Stand up, let your self be counted for what you belive in
so you don't loose your p
riveledges and become one of the silent majority who get stomped on.

If so, it would be better to buy it from Tandy U.K. as it would have cellular capability from there. If anyone needs the number or address, please e-mail me for it or I can post it here. Tandy U.K. is the "Radio Shack" found in England. They do ship out equipment, I have all the details over here (need to dig them out) right down the the phone number).

> L.B.
>

If they want to sell radios, they will have to start selling the parts
and instructions to mod it back to original design as a separate item
not requiring FCC approval and falling under parts and raw semiconductors
which there is no ban on. Most people who buy this type of equipment
would understand how to upgrade it to its original design given parts,
bag, maybe pre-assembled rf module (module on its own would not violate
the law as it by itself is not illegal).

I am all for IGNORE THE LAW!

'Nuff said!

Steven

Man! I hope not: AOR hasn't fixed all their *existing* scanners yet.
By the way, there doesn't seem to be much of a shortage of cell phones.

> Anyway, has anyone else heard anymore about this new hand-held? I believe

Jeez Steve, what do you have against us Canuks that you'd lump us with the Germans and prefer the Brits? (decidedly unPC statement in jest... really!) Sure we've got you over a barrel on Duram wheat 'cuz you've...

Sorry, I did not mean it to sound quite that way, I was attempting to stress there should be other sources in the U.K. and not only leave two countries available. I admit it was poorly worded.

All this junk about April 26 has aggrivated me since it is quite unenforcible for personal importation (reasons are explained elsewhere), and yet every company who will see lost sales is banking on it!

Sorry,

Steven

3526. Looking for a railroad scanner...I think.

Your correct. I have the 2006 schematics. They show the transformer
always stays on generating ~14VDC. This supplies power to the backup
memory. Only if the unit is unplugged does the backup battery kick.
Makes sense, otherwise your backup battery would always be dying.

Not new, but the only thing available I know of. Better than RS book.

==========

Many Thanks to Chris Howell for the Following
Listing of Regional Emergency Frequencies

==========

DALLAS/FORT WORTH AREA FREQUENCIES(tm)

The public version of this list was first compiled in August of 1985.
Since then, it has grown, both in accuracy and popularity. It is the
result of many hours of research and data entry. This list is distributed
free of charge and may not be sold by any persons or organizations without
first obtaining permission in writing from Howell Consulting. Additions
and corrections are requested and greatly appreciated.

The Dallas/Fort Worth Area Frequencies(tm) list has 2 versions.
The Public version has basic frequency data and is available to the general
public. The Emergency Services version has the same data plus transmit
frequencies and CTCSS tone frequencies for each entry. The Emergency
Services version is restricted to Law Enforcement, Fire, EMS, radio shops,
and disaster organizations.

Requests for either version should be sent to Howell Consulting,
c/o Dallas County REACT, Box 223955, Dallas 75222. Request for the
Public version should include a self addressed stamped envelope capable
of mailing a 8 1/2 X 11 computer printout. Requests for the Emergency
Services version MUST be on department or company letterhead and be signed
by an official of the rank of Assistant Chief or above. These requests
should include a self addressed stamped envelope capable of mailing a
computer printout 11 X 15.

Receive and transmit frequencies are based on a mobile radios
configuration.

Any and all versions of the Dallas/Fort Worth Area Frequencies(tm)
list are copyright 1988 by Howell Consulting. The Public version may be
reproduced, copied and/or recirculated, in any manner, as long as it
remains unmodified in any way. All opening pages and closing 2 pages of
text must be included. The Public version of this list may be given away
with the purchase of communications equipment as long as the list is also
made available to the general public on a no purchase required basis. The
Emergency Services version may not be copied, reproduced, circulated,
loaned, given or in any way removed from the custody of the registered
agency. Any violation of the copyright will be investigated and pursued.

New versions will be posted on the following computer BBS' (with
the permission of the SysOps):

5th Dimension (214) 416-6382
ASSIST RBBS (214) 475-5282
Datalink (214) 340-5850

Dallas County REACT

Dallas County REACT was charted in 1962 for the following purposes:

1) To develop the use of the Citizens Radio Service as an additional source of communications for emergencies, disasters and as an emergency aid to individuals;

2) To establish 24-hour volunteer monitoring of emergency calls, particularly over officially designated emergency channels, from Citizens Radio Service licensees, and reporting such calls to appropriate emergency authorities;

3) To promote highway safety by developing program for providing information and communications assistance to motorists;

4) To coordinate efforts with and provide communications help to other groups, e.g., American Red Cross, Civil Defense and local public authorities, in emergencies and disasters; and

5) To develop and administer public information projects demonstrating and publicizing the potential benefits and the proper use of Citizens Radio Service to individuals, industry and government.

Dallas County REACT is one of the leading and largest REACT teams in the nation and the largest REACT team in Texas. Dallas County REACT is celebrating its 25th year of public service during 1987 and would like to hear from you if you're interested in joining us.

Dallas County REACT communicates using;

1) Citizens Band Radio (CB)
2) General Mobile Radio Service Frequencies (GMRS)
3) Amateur Radio (Hams)
4) American Red Cross nationwide disaster radio system.

If you would like more information on Dallas County REACT, send in the coupon on the next page or call (214) 969-1033.

It's the CPU which is manufactured by NEC, and it seems like Nissei (the
MANUFACTURER of the handheld scanners sold under the brand names AOR,
Fairmate, Camnis, Trident, etc. etc. etc.) is last on line.

> Anyway, has anyone else heard anymore about this new hand-held? I believe

Yep, it's supposed to be the "Yupi killer" with alphanumeric display, and
other hinted-at features. So far no hard facts ... if Jonathan Clough is
listneing perhaps he'll chime in with anything additional.

HI folks !

I got those scanners:

- RS PRO-2004;
- RS PRO-35;
- RS PRO-2025 (patrol man).

If you knows any mods for those scanners or where I can get it
(like FTP sites), please E-Mail me.

Great thanks !

I am the International Editor for RCMA- a radio monitors club based in the US with some 2000 members- some of whom are outside the US and Canada. I have been monitoring around the world and collecting frequencies, etc, for more than 25 years. From this I have put together a book called `Monitor the World'. I correspond with about 200 monitors around the world and receive and exchange data daily. I would be happy to exchange/share information with you. Let me know specifically what you have and what you need.

3546. Re: Scanning Trunked Syst

Newsgroup: rec.radio.scanner
Date: 1994-05-08 13:31:07 UTC
From: Rickey.Stein@illusion.metronj.org
Message-ID: <b6a_9405081609@nisc.fidonet.org>
Source record: 274600

It may be advantageous to program the input frequencies of the trunk into your radio. This will allow you to track the handoff easier especially in larger systems or in systems with anti-scanner tones or buzzes. You do have to be close to the transmitting unit but it has worked well for a number of monitors. You can always use a combination of both input and output freqs to try to follow the movement.

3547. Mods for the Pro44 and 2022 scanners

Newsgroup: rec.radio.scanner
Date: 1994-05-08 14:48:35 UTC
From: oddjob@cix.compulink.co.uk
Message-ID: <CpHnsz.C86@cix.compulink.co.uk>
Source record: 274597

Mods for the Pro44 and 2022 scanners

Is there a FAQ sheet for mods for these scanners....they are on sale in the uk for 99.99 ukp.

It would be nice if the pro44 could cover 800-1.3ghz or parts there of...

and

Pro2022 could resolve SSB, increase sensitivity....cover more fill in the gaps....

regards

oddjob@cix.compulink.co.uk

> actions of the cellular telephone industry. I'm not aware of any
> scanner groups coming forward to defend Amateur Radio for any
> reason in the past. And, so far, no one has persuaded me that:

And as long as the League has that attitude, nobody will step forward in support. ARRL is perpetuating the idea that there are two kinds of radio hobbyist - hams and everybody else. Not a positive attitude, IMO.

> 1. ARRL, an organization that represents licensed radio
> amateurs in the United States, had any business sticking
> its nose into this affair, unless asked.

Licensed radio amateurs also use scanners. We have access to transceivers which tune outside our allocations, too. Or at least we did until April 26. How cheap do you think 902 MHz equipment will be now that the commercial companies like Icom are not mass-producing receivers with that coverage?

> 2. The ban in any way affects the operation of US hams, which
> is essentially what ARRL told FCC.

Incorrect assumption, as above.

> fact. To lie and say it somehow affects ham radio would have
> done nothing for anybody.

Again, I disagree. If it affects availability (and consequently cost) of radio equipment, it affects ham radio.

> Now I'm really going to walk out on the limb. While NRA
> members are constantly victimized by the actions of criminals
> who use firearms, scanner users are often their own worst
> enemies. This newsgroup is available to anyone with a terminal

I agree completely with all of your comments after this point!

BTW, NRA just lost a big one in the US House of Representatives, so their influence may be on the wane.

3549. Replacing BC100XLT

Newsgroup: rec.radio.scanner
Date: 1994-05-08 19:56:11 UTC
From: berling@alleg.edu
Message-ID: <2qjg4r$20s@mustang.alleg.edu>
Source record: 274622

I have finally decided to replace my beloved BC100xlt. It is beaten up beyond usefullness. I am looking for advice on a handheld to buy with similar features (I don't need more than 100 ch.) and a similar price. Should I just buy another 100XLT? Any and all help will be appreciated.
Also. can anyone recommend an antenna for it that might be band specific? All listening is VHF/UHF, with large emphasis on UHF. Thanks again.

I trying to set a range of frequencies on my new Yupiteru MVT-7100 and
cannot succeed. I repeat exact steps, as it described in manual (page 64).
Even with their freq. example and bank No.
All beep and blinks are exactly as they described on the manual.
But when I trying to read channels - I see only the old values, setted before.
Nothing had changed.
Did I do something wrong?

No strong attack intended.
If ARRL had found common cause with scanner users on this, fine.
But, agreed, you-all had no obligation to oppose the ban.

Curious: is the text of ARRL's response to the FCC available anywhere?

Two questions on the R-72.

#1. I have one that has the clock reset problem described in M.T. last month. I did the fix with the 1N914 diode on the end of R-10's lead and then soldered the cathode to the fuse holder on the other end just like the article described. The problem is the clock still resets. Is the article right? Is there also another fix?

#2. I'm using Radio Manager for Windows to control my R-7000 and it works great, using the recorder remote jack for a squelch detect. The problem is the 72 doesn't work the same way. It scans like crazy but never detects squelch even hooked up like the 7000. What's different? Any ideas?
Thanks....Les

There is a device currently available that bypasses the 'jingle' in GE systems
and continues scanning. I heard someone in my area had one, and saw an product
announcement in Monitoring Times. That's all I know about it. Anybody else
have any info/experience with it?

Just to be sure at the start of the process all the bank #'s are flashing at the top of the display - right. Then the key is to wait - enter one limit and wait until the radio takes it and prompts you for the next limit - it's prompt is that the first freq. you put in goes away - now put in the second limit and wait for the freq. to go away now it's time to put in the bank # (0-9) hit the enter key and now you are ready to use that search-bank. Now is the time to set the mode and step you want. Good luck, hope this helps.

>Radio Shack is giving up on it so soon?

Because it picks up the cellular band...they have to close it out due to
some stupid regulation that makes it illegal to monitor cellular.

At one time I had a case for my 43 (before I lost it) that I purchased from
Transel Technologies. The case was made from the same type of semi-elastic
material that divers wear (for insulation). The case worked very well, and
even absorbed some of the shock from the unit falling on the floor.
I don't have the phone #, and if nobody on the nets tell you the #,
try 1-800-555-1212 and ask for their number...

>
>Man! I hope not: AOR hasn't fixed all their *existing* scanners yet.
>By the way, there doesn't seem to be much of a shortage of cell phones.

Well as to how "genuine" the CPU story is I don't know but NEC
apparatnty have umpteen thousand of these things on back order
and the manufacturers of the set only want a small number in
comparrsion to other users and have ended up at the back of the
queue !

This radio is not being made by the same crew that produced the Fairmate
HP100/AR1000/Trident TR1200/Camnis HSC-010 radio (all the same), or the
Camnis 50/TR-2400 or the AR1500 or the AR2500 or....or.......how long is this
list....

I am not 100% sure as to the manufacturer is, perhaps somebody
may have information on that but certainly AOR wanted
to move away from the problems they had with the above radios
(Hence one of the reasons why the AR1000 is now being sold in the USA under
the Trident name of the TR1200).

As of Friday last week anticipated delivery was the end of this month (May). After
Saying that though the AR3030 HF receiver was due in "QTY" at the
end of February...so far we are still waiting.......

Hopefully should see something in the flesh towarsd the end of
this month....but we are talking AOR here so don't bank on it.
Anticpated price is in the region of 450GBP here in the UK.

There are all sorts of, "hinted-at" features, Richard at AOR has
completed the instruction book apparatntly which runs to some 100
pages so I assume there is a fair bit to get to grips with.

I hope to "play" with one next few days but we'll have to see.

I just took delivery (purchased) in ICOM 7100 on 5/6/94 which was after the 4/26/94 cutoff date. From what I've read and been told, only the manufacture or importation of the ICOM 7100 or similar units was prohibited after 4/26/94. For those of us that own scanner capable units, the price should now appreciate in the used market. The dealer that I purchased my ICOM from told of an incident where one of the ICOM handheld cellular capable units was bought recently at a significant premium over its original price.

one other tip: make sure you have a step size selected that allows the
particular frequency you want to be entered. For example if you are using
a step size of 5khz, you cannot enter a frequency like 460.0125. It will
wind up being accepted as 460.010

Hi,

I have a YAESU FRG-9600, complete with power supply, service manual,
video module fitted, plus scanning software with easy to build interface for
computer controlled scanning. Also throwing in a Datong ARA-900 active antenna,
all for about US$230 (add shipping charges). Interested please let me know.
Tks.

BTW, the radio has a HF convertor built in with separate antenna for HF and
also a pre-amplifier for HF built in. Final frequency coverage is from 500kHz
all the way up to 950MHz, fully dial tunable or computer controlled. All mods
added already so covers cellular bands as well.

73,
Daniel

I can't believe the similarity in our names! I found some code which just took care of the necessary calculations for VCR+ and wrote a external command (For Hypercard on a Macintosh) which allows me to enter 6 parameters and produces the code. There is also a massive lookup table which needs to be produced. Interesting stuff since our local TV guide does not include the code.

From: rats@cbnewsc.cb.att.com
Message-ID: <CpJxsG.CK1@cbnewsc.cb.att.com>
Source record: 274532

According to a LESCOMM brochere received Saturday, the new PRO-2006A scanners have a different microprocesser IC with different pinouts from the IC in the 2006, and there is no diode to be had for cutting to rcv out-of-spec frequency. So, Rat Shack has killed off a major reason to purchase their once-great PRO-2006 series scanner. Let's hope that Rat Shack's next super base scanner will be PRO-43 style which will be modifiable by relatively unskilled folks...

>Rickey Stein
> International Editor, RCMA

Can you explain why monitoring the inputs might make it easier to monitor the handoffs (say for a Moto system)? It seems like it wouldn't make much difference. The input freqs are going to change the same as the repeater output freqs (inputs will just be 45MHz lower). Is it just because of signal strength reasons?

I just though I would pass along a few posts from CIS on the new BC220XLT and SportCat scanners from Uniden.

Subject: #BC220XLT Performance - Msg Number: 265284
From: Jeff Goldman 76703,4224
To: Howard Bornstein 76174,637
Forum: HAMNET Sec: 02-VHF/UHF Scanning
Date: 04-May-94 09:56:58

I've only played a bit and it's charging up at the moment. I'm VERY impressed with it. Naturally, it is double conversion so it certainly gets its share of images. The audio is probably the same as the Pro51's, which means it's really good! I don't have a Pro51 here, so I'm just guessing from memory. The modified Pro43 is still hissier than the BC220XLT; I really like the audio from this Bearcat! (Naturally, it can't touch the larger Yupi.)

You CAN enter frequencies without the decimal (like with older Bearcats!). Also, you CAN unlock all Search lockout memories by holding down LOCKOUT for 2 seconds while in the Search Hold mode. Same deal with the Service Scan Hold mode!!!

While the scanner remembers Service Scan Lockout memories and Search Lockout memories when you turn off the scanner, it does NOT remember Turbo Search! You have to hit the Turbo button to get it to search 300cps rather than 100cps. Also, as you know Howie, you can't use Priority in Search, though the scanner does have Priority memory so that if you turn off the scanner and turn it back on, it'll remember if the Priority feature is enabled. You also can't use Priority in Service Scan. I'll have to try that later with a Pro51. The scanner does remember if you had Data Skip enabled last time you were in the Search mode.

One thing that I wish I could figure out is a way to go back to the beginning freq of a Service Scan. The scanner remembers where it last left off in a Service Scan mode.

Also, it's too bad that you can't use the wonderful Data Skip in any mode other than Search. And you can't use it when searching Aircraft. It does work wonderfully when searching everything else though. Also, why does Uniden have to stick with 12.5kHz increments in the Aircraft band? That effectively cuts the speed of the BC220XLT and Pro51 down to that of the Pro43 in that band. (Remember, 300cps is only available in VHF-Lo and VHF-Hi.) So the Unidens' 100cps in Air is equivalent to the GRE Pro43's 50cps Air search in the correct 25kHz increments.

You were right about the contrast being very good, as is the backlighting.

The size of the jack seems to be identical to the Pro51's, so I'd think that the RS mobile adapter should work fine. That's the one with the Adaptaplugs. Voltage is 12v and tip polarity is positive. Naturally, Uniden has their own mobile cords (with no transformer needed)- one straight and one coiled.

The optional battery pack for the scanner will be $19.50 plus shipping. No word on when it'll ship. And no price or date on the upcoming leather case.

Like the GRE duckies, the Uniden ducky seems quite acceptable on those bands included in the BC220XLT, plus it's very nice-looking. And yes, those cellular images ABOVE the real band come in very strong and clear. It helps a bit that the BC220XLT has the Uniden-GRE Zeromatic feature, though you're still going to have some conversations a bit off freq. (Not that I'd ever listen in. <g>) Nice that coverage starts up again after 894 and NOT 896MHz like in the SLOOOOOOOOOOW Pro46! That gives you an extra 2MHz of cellular images over the Pro46.

Nice to know that I have one of the first 6 in the country. And, yes, this is one time that being the first doesn't seem to mean having a defective radio. <g> Hopefully, the battery-drain problem of the BC2500XLT was fixed. Certainly, the sound is much better than the BC2500XLT, and you were right that the squelch tail is shorter than the Pro51's! Yep, they fixed it. And they finally designed a decent beltclip (though it still ain't an AR1000-like metal one).

Overall -so far- I'm VERY happy with the new generation of Bearcat scanner and its performance. Nutin's perfect, of course, but it is definitely what I'd have hoped for in a Pro52. Now, to see if there really will be a Pro52! <g> That would be pretty exciting, but still no word from RS yet about such an animal.

I'll let you know what I find out about getting a replacement battery pack from RS. Just don't hold your breath. :-)

-Jeff

PS My serial number is 45000046. Does that mean Glenn's unit was 45000073? My date of manufacture is the same as that unit- "ODID" which is April '94.

Subject: #266154-#BC220XLTs AVAILABLE NOW! - Msg Number: 266350

Forum: HAMNET Sec: 02-VHF/UHF Scanning
Date: 07-May-94 12:15:34

Jeff and all

I have had a little time to putz and program my Sportcat. Some random observations: The audio is good but low level. The manual shows 180 mW to the speaker. I programmed in a variety of police and emergency frequencies from the St. Paul, Minneapolis and surrounding area. As with some previous Bearcats I have owned I notice no real intermod problems. The sensitivity is also quite good. I briefly had a 890 XLT which could not pick up the St. Paul Police 12 miles south of me with an outdoor antenna. The Sportcat part comes from the first bank of 10 channels being individually selectable by the 1-0 keypad when the radio is in the direct and not bank mode. The manual recommends putting your sporting event frequencies in channels 10 and in the direct mode it will only scan those channels. There is also a direct channel memo pad between the display and the keypad in which you can write (very small) what is in channels 1-10. Given the low level of audio you would definately need headphones at any kind of sporting event. The delay is 2 second global. I am

still not sure about the effect of the Data Skip feature for the search mode. At times I have noticed it works well for obvious data other times not a all. The intermod for 800 MHz cellular comes through just fine above the cellular range. It was of course only by accident that I heard those calls. :-)

All in all I will have to admit that in the past I have not been a big Uniden fan, even though a 210 10 channel was my first programmable years ago. I do like the Sportcat. It is a good scanner for the money especially considering that the newest RS made by Unided is a 50 channel for the same price. I really do not think t hat the Sportcat theme is that big of a deal and do not lead you to think that there is something about this radio that makes it just for sporting events. Maybe Uniden will introduce more theme scanners: The BareCat-for scanning nudist colonies The AirCat-for air shows The SnoopCat- for cordless phone listening The FatCat- For scanning weight loss clinics etc.

Next up battery life and using it on an outdoor antenna. Any questions, I will try and answer them.

Greg

Subject: #266350-BC220XLTs AVAILABLE NOW! - Msg Number: 266570
From: Howard Bornstein 76174,637
To: Gregory E. Renner 74261,1214
Forum: HAMNET Sec: 02-VHF/UHF Scanning
Date: 08-May-94 03:36:27

Greg, I got to play with a SportsCat today and was also impressed (and a litte bewildered). It took me a few minutes to figure out that the Hold/GoTo button was basically the Manual button. I guess they figure that the customers for the SportsCat will all be new to scanners and won't mind learning a different naming convention. <G>

I wasn't able to see a great advantage in the direct channel mode over normal scanning. What do you think? Perhaps if all ten of the channels were extremely active so you couldn't scan them in the normal fashion it would have some use. The Monitor channels of the Radio Shack scanners do the same thing and I've rarely used them in this "SportsCat" way.

>> The delay is 2 second global.

Would you double-check this for scanning? The BC220XLT has individual channel delays.

WRT data skip, I've found that it seems to work most consistently on signals that have a "white noise" component. It seems to be designed to skip open carriers and similar noise. It frequently *doesn't* work on computer data channels and other real signals. In addition, if you have a weak signal that has noise mixed in with it (e.g. a weak voice over some hiss) the data skip feature will key into the hiss and not the voice and skip the transmission! (well, nothing's perfect!)

You didn't mention what I think is the SportCat's best feature: the ability to lock out up to *100* frequencies during a search! This capability makes a double-conversion,

intermod-prone scanner immeasurably more usable.

BareCat, AirCat, etc. ROFL!!!!! That was hilarious!

Regards, Howard

3584. Info on new Opto 456 Pro2006 controller

Newsgroup: rec.radio.scanner
Date: 1994-05-09 21:31:34 UTC
From: brett_miller@ccm.hf.intel.com
Message-ID: <brett_miller.199.0015875A@ccm.hf.intel.com>
Source record: 274529

Some info from CIS on the new computer control hardware/software sold by Optoelectonics for the Pro 2005/2006. The software for this thing was written by Sam Dunham who wrote ScanStar. Even Bill Cheek said this thing is better than his HB232.

Subject: #265396-#New Opto Interface - Msg Number: 265933
From: Ed Lentz 72645,172
To: Daniel M. Conti N2TYB 71242,1774
Forum: HAMNET Sec: 02-VHF/UHF Scanning
Date: 06-May-94 05:16:58

I received my Optoscan 456 the other day and have to say that I am impressed. The board installed without any cutting or soldering of anything. All connections are made using existing plugs and cables supplied with the OS456. There is one wire that can be soldered and I think should be. It is on a Test Point in the scanner and very easy to get to.

The OS456 fits very well inside the 2005/6 scanner and is very well supported with mounting brackets supplied by Optoelectronics. It takes about 15 - 30 minutes to install using the Video Tape supplied. The Video Tape thing is very good since you can actually SEE how to install and if you miss something you just rewind the tape.

The OS456 will allow you to use the scanner in the normal mannor including using the battery to back up the memory in the scanner. When I plug in the OS456 and start the program the radio will immediately stop what it was doing and the display goes blank along with the keypad. All functions from that point on are controlled by the computer software. The decoding of CTCSS/DPL tones and also the ability to scan using the tones is included in the board.

When I finish using the computer program the scanner will immediately switch back to normal operation without doing anything. Suckers automatic in determining how to work.

I find it short of amazing how well constructed something from a radio vendor is for this scanner. The 2006 is most likely one of the better radios on the market right now including the ICOMS, AOR's and all the other scanners. The addition of a $299 board and computer program make it a totally different product. You now have total control of the radio via computer.

I understand that the HP-100XL palmtop computer can be used to control the 2006 scanner. Will try this in a week or so and then I will have a super mobile scanner. Figure on mounting the scanner in the back of the Pathfinder and use the Palmtop to control the radio. I already have 7 radios in the truck so space around the drivers seat is a bit cramped.

Subject: #266065-New Opto Interface - Msg Number: 266101
From: Judd Sheets WA4BUS 74003,3254
To: Russell Keating 72040,3672
Forum: HAMNET Sec: 02-VHF/UHF Scanning
Date: 06-May-94 18:12:20

Russell, I helped design the OS456 and can tell you that the largest delays in scanning the OS456 are the serial CI-V traffic and PRO2006 PLL lockup time. The OS456 only needs about 300-400 microseconds from the time it gets its command to when the PLLs are programmed, but they take about 10 milliseconds to settle.

On a 386 PC, scanning speed including looking for PL codes etc. is about 22 channels per second at 9600 baud. We also support 19.2 kB which should speed things up somewhat.

Judd

That particular bit is wrong. The PRO-2006A has been on the market for
almost 2 years. The only difference between it and the original '2006 non-A
is that the newer model has an on-off switch for the display backlight instead
of a dimmer switch. No other changes were made.

Singapore has very restrictive laws on what frequencies can be received and the equipment available in the stores reflects what can be listened to. You will not find scanners, CBs, or even much ham equipment around. Chances are if you take a scanner in and they catch it at customs it will be held until you leave the country or confiscated on the spot.

Understand that here there is still a law that requires each purchaser of a common radio or TV to purchase license for each receiver and TV you own.

I'm going to be driving from Austin, TX to Baltimore, MD in about 2 weeks.
I have a BC100xlt and would like to take it along with me to give a
little "information" about road conditions, troopers' locations, etc.
I will be travelling through Texas, Arkansas, Tennessee, Virginia, and
Maryland. Two questions:

1. Is it legal to use a scanner in an auto in all of these states?

2. Can anyone recommend the best frequencies to monitor during my
voyage?

Any help is appreciated.

Kevin

I enjoy listening to all sorts of _stuff_ and I hate the noise/tones
that go with some of it. In my search for a cheap filter, I bought a
Radio Shack _Wide range stereo frequency equalizer_. That's a 10 band
stereo graphic equalizer in people speak. I took the tape out from my RS-2006
and fed it to the left channel input. I checked the output with
headphones and yes, I was able to boost and cut noise at will! I then
took the left output and fed it to the right input and checked the
headphones again. It provides a lot more filtering.. more than I actually
needed. So, I hooked the output from my Sony 2010 to the right channel. I
now have the 2006 in the left channel and the 2010 in the right channel.
Ican filter them seperately though I haven't tried to listen to both at the
same time but... I needed a few adapters to get from RCA to phono and
back again, but I only paid $25 for the equalizer at a swap meet.
Hope this adds to your listening enjoyment like it has to mine.

take care

Here's my pro-46 story...

My boyfriend's birthday was last Saturday, and I couldn't decide what to get him. (A tie? Of course not. Something engraved? Already done that. A new hi-tech toy? He already has them all... except!! The logic was clear!)

So I went to the Good Guys thinking scanners are electronic, right, and they are an electronics store. The salesman there told me scanners were *highly illegal* (as opposed to *lowly illegal* I wondered to myself...) so I almost gave up. I asked a few friends, all of whom told me, go to Office Depot and Staples. Although it seemed an odd suggestion, I only realized (duh) at the store's customer service desk that my friends assumed I was going to give him a computer-scanner (e.g. 600 DPI kind of scanner). Laughing, I drove home, but on the way, destined to find that perfect gift, I passed a Radio Shack and thought, "why not, a scanner is a *radio*" Wow! Imagine my surprise when they had 'em!!!

Now, in order for you to grasp the true extent of my ignorance, imagine if you will my INCREADIBLE amazement and WILD surprise when the nice man behind the counter actually turned one of them on for me...
(me): "What's that?"
(him): "That's the North Hollywood police department"
(me): "No Way! Really?"
*(mvs): "...Wells Fargo on Riverside... Suspect last seen running North... One thousand dollars stolen..."
(me): "You mean you can *actually* hear the cops!!!"
(him): "Yeah, of course. What did you think you could hear?"
(me): "Uhhh, I don't know, uhhh, live weather reports and maybe, if I was lucky, some Taxi drivers."

[* = Mysterious Voice coming from Scanner]

He just laughed, looked at my total and complete transfixtion as I stared at the M.V.S., and asked me simply,

"So which model?"
Anyway, aesthetically, I was completely opposed to the Pro-46. The thing is about one of the UGLIEST tech-toys I've ever seen; seriously, who ever designed the "look" of it is clearly a beauty school drop-out. But, knowing nothing about scanners, 100 channels seemed better than 10 and cheaper than two hundred. 10 banks seemed properly imposing, and the frequency list was as long as any of the others... (BTW, only today did I figure out that the list is as long, but not as complete... I didn't look at the actual numbers in each set on the list until I read a thread here that mentioned frequencies.)

And besides, it was on SALE! Yeah, I thought, I can live with giving an ugly-looking scanner for an extra forty bucks in my pocket, especially considering the alternative was almost $120.00 bucks more.

So, I wrapped it up, gave it to my boyfriend, and now play with it twenty four hours a day (not to worry, I let him play with it a few minutes each day while I'm in the shower :-). I'm hooked! (Is there a twelve step program for this?)

Since I really know nothing about scanners, my opinion is meaningless, but nevertheless, I really like it, I'm even getting used to its "ugliness"! So now I'm reading this newsgroup, ftp'ing to get more scanner info, looking for good "starter" books, thinking about buying my own (and letting him have his back :-))and then figuering out how to do "mod's" so I can get the missing 800 frequencies!!!

Anyway, just my contribution to wasted bandwidth...

Well glory be: The Yupiteru MVT7100 is just about as difficult to modify
as the RS, to wit: surface mount device needing to be removed/relocated.
Maybe Yupiteru should push harder for certification?

But someone did mention that the MVT7100s emit a lot of RF. Does anyone
know for sure if this is true?

I looking for a frequency lists in Toronto area additionally to ones
described in Haruteq 10-th ann. book.
Is there any magazines, BBS-s or other sources of this kind of info
(for Toronto area) ?
Another information I looking for is police codes 20-xx, 16-xx and
AMB codes. Any pointers?
I'd appreciate any posts and replies related to scanning in a Toronto
area. I just purchased scanner and have no much experience so far.
Thanks,

Chris, what you need is the Scanner Frequency Directory for Northwest Ohio and Southeast Michigan by Darryl Symington. It covers the majority of the metropolitan areas around Detroit and Toledo. And, since it is just for these areas, you get a lot more useable frequencies, as opposed to Police Call which is a good publication, but is spread over two entire states. This book is available at Adray Appliance in Dearborn , (313) 274-9500. The price is $11.95. The newest edition has a pink cover. Hope this helps your listening.

I have used the MVT7100 with my Pro34 and Pro2006 for a few weeks and I haven't noticed the Pro units locking onto anything strange. Of course, this isn't really a scientific answer. I will say that when scanning the Yupi alonside my Pro34, I noticed my Yupi would pick up whatever the Pro34 was locked onto 10.7 MHz away. So, it looks like the Pro34 10.7 IF is extremely leaky. I could get the Yupi to lock on up to about ten feet away from the Pro34.

In our local system (at least) the system is set to cascade "downwards"
when a frequency is let go

i.e. 860.2375
859.2375
858.2375
857.2375
856.2375

One of these would be the handshake channel of course. I've also noted
that the control tones rotate the same way and this could be a clue as to
how your (Motorola) system works. Repeater hang time also drastically
affects how well you can monitor a given system.

I seem to remember reading a FAQ on trunking (by Brian Kantor?) that
indicated that all of these parameters are user configurable (OK -
sysadmin configurable) so YMMV ...

3611. Indy 500 frequencies (I have some!)

Newsgroup: rec.radio.scanner
Date: 1994-05-10 15:45:12 UTC
From: scott@redstorm.nawc-ad-indy.navy.mil
Message-ID: <199405101544.KAA06441@cs.utexas.edu>
Source record: 274563

I blew off work yesterday afternoon (5-9) and went out to the Indy 500 track to try to track (pun intended) down some frequencies for the various teams. I used my trust PRO-34 and a pair of KOSS headphones that completely cover the ears. The choice of headphones is very important because you need to have a pair that completetly cover and seal your ear because of the noise. Don't try to use the walkman type headphones with the foam because you will have a very hard time hearing anything.

I found out it is a very slow process to find the team frequencies. I searched mainly from 460-470 MHz. I think some teams work down in the lower 450's and some have moved up to the 800's. I didn't try searching up in the 800MHz region. There were also a lot of data channels which may or may not have been telemetry data from the cars.

I had a lot of problems with intermod and images while out at the track. It seems to be a VERY high RF area. Local businesses would transmit and completely overwhelm the 460-470MHz band I was searching. I was also hearing images of the ESPN feed throughout the 460MHz band. A triple conversion scanner such as the PRO-43 might have better success as sniffing out new team and race control frequencies. My poor PRO-34's front end was just overwhelmed. However, I was able to come up with the following frequencies. Most of these I could not identify as a specific team or driver, but was able to identify them as being part of the race.

If anyone confirmes these or finds any new freqs, please let me know.

Indy 500 Frequencies found on 5-9-94:

Race control:

463.650 Track control
464.200 Safety crews
466.850 Track control?
466.9875 Track control
935.137 USAC #1 (Pace car?)

Drivers:

462.8125 Possibly Raul Boesel (sounded like Emmo, but I think
the Penske cars are in the 800 MHz band and scrambled)
463.7625 Sounded like Lyn St. James
465.2375 Sounded like Arie Luyendyk, but not 100% sure.
466.2875 Nigel Mansell

Other teams I could not identify with any certainty:
Most of the talk was about the feel and handling of the car and the setup.

460.300
460.700
462.575
463.9125
464.725
469.2625
469.825

Other miscellaneous freqs found:

461.850 caterer?
466.850 caterer

I heard several local television station broadcast feeds in the 450-451 MHz and 455-456 MHz ranges. I was so near the broadcast point that it was almost impossible to tell which frequency they were transmitting on because I heard the signal on my channels. Here is a list I have for the local radio and television station broadcast remotes for Indianapolis (* signifies I have confirmed the freq & station):

450.2125 Unknown
* 450.2500 WRTV Channel 6 ABC
* 450.2875 WIBC Radio 1070 AM
* 450.3375 WIBC radio 1070 AM
* 450.3875 WXIN channel 59
* 450.4125 WTHR Channel 13 NBC
450.4875 unknown
450.5625 Unknown
* 450.5875 WISH Channel 8 CBS
* 450.6125 WFBQ Q-95 94.7 FM
* 450.6500 WFMS Radio 95.5 FM
* 450.7000 WIBC Radio 1070 AM
450.7500
450.8000 WRZX 103.3 FM radio
450.8875 Unknown ??
450.9000 Unknown
* 455.2875 WIBC Radio 1070 AM
455.5625 unknown (TV?)
* 455.6500 WFMS radio 95.5 FM

3613. Detroit Frequencies

Newsgroup: rec.radio.scanner
Date: 1994-05-10 16:44:10 UTC
From: mkeiser@scca.Eng.Sun.COM
Message-ID: <2qodkq$jrf@engnews2.Eng.Sun.COM>
Source record: 274564

Greetings!

After several years of working SCCA Pro Racing as a radio tech, I'm finally going to go to the Detroit Grand Prix (@ Belle Isle) as a spectator! I would be most grateful if anyone would post a list of interesting Detroit-area frequencies to listen to during the week. I suspect I can find the race frequencies (from experience), but would appreciate anything else that local Detroiters find interesting to monitor. I'll be staying in Dearborn, visiting Greenfield Village and the Rouge, and the RaceRock Cafe. And staying out of Detroit after dark (unless I go to the RenCen).

Thanks in advance.

Mark

Actually, I saw a pretty good selection of ICOM ham HTs at the electronics stores in those strange shopping mall/bazaars right next to the big hotels in Singapore...several models were there that hadn't even been announced yet in the states.

Strange little country, Singapore...The locals delighted in asking if the heat and humidity were killing me...when I'd reply that it wasn't, they seemded disappointed, and asked why not? I told 'em, "I'm from Houston - this would be a mild spring day there". They were baffled.

If you're ever there, don't miss the lunch buffet at the Raffles Hotel...mighty good food. If you want seafood, check out Newton Circus (or was it Circle? don't recall). Extremely fresh seafood of all types, and the biggest shrimp, lobster, and other crustaceans I've ever seen, along with cold beers, served outdoors in a casual atmosphere.

>I hope so.

The message traffic on CI$ says that the Opto 456 will be compatible with the computer interface for the ICOM-7x00 radios. There are some extensions for returning results from decoding CTCSS and DTMF codes so you may be able to use one of the Mac based R-7x00 packages.

Rachel, try these questions:
WARNING SIGNS OF BECOMMING A SCANNER-NUT

Can you ID a radio's freq by looking at the antenna?

Do you know what fire station is being dispatched by
listening to the pager tones?

Do you start reading plates by the police phonetics?

Can you quickly translate a vanity plate read in phonetics?

Do you have a 'favorite' dispatcher?

Do you curse the newspaper for not printing anything about what
you heard last night?

Do you know at least 15 vehicle/penal code sections?

Are you on a constant search for the 'best' frequency manger
program?

Do you yell at TV shows that use scanners in place of 2-way radios?
(trivia- wha t scanner was used as a 2-way radio on 'Starskey & Hutch'?)

When you promise to sell your old scanner when you upgrade, do you
find a conveniant use for it SOMEWHERE?

Can you rattle off at least 10 local PD/Fire freqs by memory?

Do you put off everything on Saturday night to see "Cops"?

Do you have twin spotlights on your car?

Have you ever slipped and said 'Code 7'when taking lunch, and your'e
an accountant?

Do you know exactly when you are leaving one 'beat'and entering
another?

When someone says 'trunk' you don't think elephant or car compartment,
you think 'ARRRRRGH!'

I've used thr Realistic counter and been fairly happy with it. My needs are modest and I've used mainly on homebrew bench work typr projects. For checking CB, Marine VHF, and 2 meter rigs it works great. It is NOT very sensitive and would need a decent pre-amp for any kind of signal hunting.

Source record: 274569

On Monday I'll be flying United airlines out of Dulles Airport in Virginia. Does anybody know what frequencies I can use to listen in on the plane. If not, what about a frequency range. Any help would be greatly appreciated. I'm assuming there is no law against listening in except during and after take-off and landing. If I'm wrong about that, somebody please let me know.
Thanks in advance for any help that you guys/gals can provide.

regards,
Byron

Once again, Motorola's "Secure Clear" technology (I believe that's what they call it) is just simple frequency inversion. Radio Shack, among many others, sells a box that will flip the frequencies back to their appropriate bands; an easy and inexpensive scanner add-on. I wouldn't count on it to provide any real security, although I suppose it might deter "casual listeners" (you decide what fraction that is!).

Hope this helps,
-Patrick Penzias Dirks.

In the past, the primary DeeTroit PD channel in use has been 453.550 (channel 5), which is their special events channel, in addition to lesser traffic on some of the other DPD 453MHz channels & on the city's 800MHz system.

USCG freqs will also be active with related traffic.

The real beauty of this new unit is that it takes over the microprocessor and does not use any of its internal programming. So even if cellular is factory blocked and unrestorable, the Opto board can tune anywhere it wants (including cellular). Only the 2004 is not supported at this time. It should work with the 2005, 2006, 2006A and soon-to-be-released 2006B.

I have an AR1000. I am very satisfied with it.
The main difference between this and the AR1500 is that the latter
has SSB (single sideband coverage).
Single sideband is a modulation method that is used primarily by Ham operators,
FAX, and RTTY in the HF (shortwave bands). Some CB units also use it. If your unit
can not demodulate SSB (it needs a BFO to do it), those communications using SSB
will be distorted, .eg voices sound like Donald Duck.
The AR1000 and AR1500 have continuos coverage from .5mHz to 1300mHz
I find that is it is a good unit, but it takes time to learn how to use the
SCAN and SEARCH features. Suprisingly, the HF coverage is decent, but not as
decent as a dedicated shortwave radio.
The AR1500 costs around $470 - $500. I don't know about used prices, it is a very new
product. Good sources are ACE communications, or EEB.

I have an Optoelectronics fequency counter. I bought it several years ago. It is model 2210A, probably not a current model. In any event, it has two frequency ranges: 10Hz-12MHz and 10MHz-2.2GHz. It is AC or DC operable, with a LED display. Neat theory, but in reality, it's not the *most* accurate instrument. If it were to be used, hypothetically, to try and lock in on a close 800MHz source, oh... like perhaps cellular, you'd have to be quite close (30-50 feet) for 3-10 seconds, and even then it could be hard to get a clear reading. However, once learning the quirks of the unit, it DOES work, and it has provided hours of entertainment. It doesn't do well on low wattage transmission sources (i.e. cordless phone handsets, handheld cellulars under 1 watt). To sum up, its value depends on what you'll be using it for. I've been quite glad I've had mine a few times when finding a particular frequency (quite stealthily, at that) has been necessary.

>that, somebody please let me know.

You're in luck, in that you probably won't even need a scanner. It's
normal on United flights to have the ATC communications on the passenger
entertainment system. Look for it on channels 9 or 10. If it's not on,
a brief message to the pilot is usually all that is needed to have it
turned on. And it stays on all the time, from gate to gate, including the
most interesting phases of takeoff and landing.

To answer your question in general... You are right, there is no law
against listening to ATC on abord a commercial flight except while below
10,000 feet AGL (above ground level). Above 10,000 AGL, it's up to the
individual airline's policy. If the airline says you can't, then you
can't. If the airline says you can, then you may use your scanner as
long as the pilot does not object. A small sample of airlines reveals
that Delta allows scanners, while United, American and Northwest don't.
But then again you won't even need one on United.

If you still want to use your scanner while on the ground at IAD, here
are some frequencies:

ATIS 134.850 [or call (703)471-7127]
Approach 126.100 124.650 120.450
Tower 120.100
Ground 132.450 121.900
Midfield ramp 129.550
Clearance del. 127.350
Departure 126.650 125.050

Scott et al.,

I dug these up from my files. I'm sure they're way outdated, but some of
the network and official freqs might not be. This is Racing stuff I have.
I don't know if NASCAR is Indy etc. (actually know that I think about it
Nat. Assoc. Stock CAr Racing(?) doesn't sound like the funny cars at Indy ;) but
any way....I'm sure someone can use them. I found the AVS stuff interesting
and it's probably useful to all if it isn't dated. Anyway......
If you get any *real* answers, please post them.

Carter

PS---I have no idea who the original posters/writers......

------------------------------------------------------------------------

SCANNING CAR RACES
------------------

Going to the track soon? Take along your scanner and hear exactly what is
going on. Listen to pit crews, drivers, news media, ambulances etc.
```

Source: Popular Communications
Monitoring Times
Reprinted by: John Johnson KWV8BP

Business radio service frequencies are in heavy use, with some crews using multi channel radios. It might be a good idea to see what the search/scan feature of your unit will produce for you if you let it sift through the following bands:

151.625 to 151.955 462.550 to 462.9125
154.515 to 154.600 463.200 to 464.9875
457.5125 to 457.6125 465.6625 to 467.1875
460.6625 to 460.6875 467.550 to 467.9125
460.9125 to 462.1875 468.200 to 469.9875

Also make sure to check these frequencies:

30.84 457.60
33.14 464.50
33.40 464.55
35.02 467.75
35.04 467.775
42.98 467.80
151.625 467.825
154.57 467.85
154.60 467.875
457.55 467.90
457.575 467.925

Sanctioning organizations, such as NASCAR, USAC, CART, SCCA, etc. also have there own frequencies for on sight communications, check these following freqs.

464.500 All Pro Racing Association 464.500 SCCA Glen Region

151.625 SCCA Dallas Region

Here is a list of frequencies believed to be in use by various NASCAR drivers

1 Brett Bodine 463.775 Bull's Chevrolet
3 Dale Earnhardt 469.015 Wrangler/Chevrolet
4 Rick Wilson 463.450 Kodak/Oldsmobile
5 Geoff Bodine 851.500 Levi/Chevrolet
854.500
6 Mark Martin 468.5625 alternates 463.925, 463.400
7 Alan Kulwicki 461.150 Zerex/Ford
8 Bobby Hillin 856.800 Miller/Buick
9 Bill Elliott 853.500 Coors/Ford
10 Ken Bouchard 468.5125
11 Terry Labonte 855.575 Budweiser/Chevrolet
855.525
12 Mike Alexander 451.900 alternates 464.3125, 469.3125
14 A.J. Foyt 456.9125 alternates 468.1875, 463.550,
463.1975
15 Ricky Rudd 464.300 Motorcraft/Ford
16 Larry Pearson 452.600 alternate 463.775
17 Darrell Waltrip 856.500 Tide/Chevrolet
21 Kyle Petty 463.4625 Citgo/Ford
463.4875
23 Eddie Bierschwale 462.675
25 Ken Schrader 856.925 alternate 851.575
25 Tim Richmond 851.575 Folgers/Chevrolet
26 Ricky Rudd 468.4875

26 Morgan Shepherd 468.4875 Quaker State/Buick
27 Rusty Wallace 463.900 Kodiak/Pontiac
28 Davey Allison 457.600 Havoline/Ford
463.700
29 Cale Yarborough 464.600 Hardee's/Oldsmobile
466.770
30 Mike Waltrip 466.300 alternate 461.300
31 Joe Ruttman 468.9375
33 Harry Grant 461.687 Skoal/Chevrolet
461.975
35 Benny Parsons 856.925 Folgers/Chevrolet
41 Joe Booher 469.975
43 Richard Petty 464.800 STP/Pontiac
44 Sterling Marlin 461.875 Piedmont/Oldsmobile
47 Morgan Sheppard 466.200
50 Greg Sacks 834.075 Valvoline/Pontiac
52 Jimmy Means 467.925 alternate 469.925, 464.400, 464.925
55 Phil Parsons 464.450 Skoal/Oldsmobile
466.476
67 Buddy Arrington 464.075 alternate 469.075
68 Derrike Cope 464.025
71 Dave Marcis 467.825 Lifebuoy/Chevrolet
75 Neil Bonnett 468.975 Valvoline/Pontiac
463.975
77 Ken Ragan 461.825 alternate 469.225
80 Jimmy Horton 463.4375
83 Lake Speed 859.825 alternate 463.775, 468.775
88 Buddy Baker 466.700 Crisco/Oldsmobile
90 Ken Schrader 467.162 Red Baron/Ford
90 Benny Parsons 467.162
92 David Sosobee 464.5625
98 Brad Nofsinger 461.525 alternate 461.450

Misc Freqs
AVS RACING

Aerial Video Services, out of Burbank, California, is
major supplier of the in-car cameras, wireless cameras
and communications links for the television coverage of
auto racing and other sporting events. During a recent
racing series at the Texas World Speedway, AVS provided
the microwave and communications equipment for the Prime
Network television coverage of the races. I had a chance
to work with the AVS crew, and check out their radios.
If you get to attend a sporting event where wireless

cameras or mics are in use, you might check out some of these frequencies.

Let me explain a little about the equipment they are using, and what you might hear. Any time there is a wireless camera in use, they will be sending the pictures from the roving camera location to the TV remote truck on a microwave link. They may use the 2 to 2.5 gHz or 7 gHz microwave bands. In addition to pictures from the camera, there has to be voice communications to the cameraman, and sound from the announcer's microphone, who may appear on camera, and a cue channel to the announcer, so he knows when he is on the air. The communications from the TV director to the cameraman are usually referred to as the "PL". This stands for "party line", and is a two-way communications link with the director and the camera operator. It is usually set up as a low-power repeater, so you will always hear the directors calls, and the camera operators replies. The cue channel to the announcers is called the "IFB", which stands for "interrupted feed-back". This is usually the audio from the program that is being produced, along with the director or producer interrupting the program feed, in order to give cues to the announcers. This transmitter will be on as long as the TV production truck is operating.

AVS uses mostly I-COM programmable radios. Here are frequencies that are programed into the units...

Channel Frequency
1 457.525 - This ch.used for IFB 10/18,19
2 457.550
3 457.575
4 457.600
5 467.750
6 467.775
7 467.800
8 467.825 - Car camera control data
9 467.850
10 467.875
11 467.900
12 467.925 - AVS tech communications
13 467.7375
14 467.7625
15 467.7875
16 467.8125

They also have radios programed in the 450 - 455 mHz Broadcast Remote Pick-up bands. At the racing I attended they used 455.350 as the P.L. communications to the pit

camera. 450.350 was the input frequency to the repeater. Why they used the frequencies "backwards" from what the normal repeater frequency scheme would be isn't known. The car camera control data uses a 10-watt base station that transmits control tones to the cameras in the cars. You will hear a continuous carrier with DTMF (Touch-Tone) audio tones as the commands are sent. The microwaved pictures and sound from the in-car cameras are beamed up to a helicopter that has a microwave receiver on board, and then re-transmitted back down to the TV production truck on another microwave frequency. The TV truck used 123.050 to talk with the helicopter.

The wireless mics that the roving announcers may use are Sony UHF mics in the 950 mHz band. Here is the channel allocations for the USA.

Channel Frequency
11 947.250
12 948.250
13 950.250
14 951.750
15 949.000
21 947.750
22 949.750
23 950.750
24 951.250
25 948.500
31 949.250
32 948.750
33 950.000
34 951.500

Also, for you race fans who may end up at some SCCA racing events, here are some assorted track frequencies in use at the Texas World Speedway, in College Station, Texas.
151.625 - SCCA Race Control Primary
151.685 - SCCA Secondary
151.715 - SCCA
464.500 - Texas World Speedway
464.550 - Texas World Speedway

Other events could use same freqs for wireless cameras.

More Auto Racing Freqs

Victor,

Here are two list of NASCAR frequencies. I take credit for neither. The name of the author of the first listing is unknown to me. Robert Ford posted the second listing a while ago here on

USENET.

Regards,

Kevin

NASCAR frequencies 1992/1993 season listing

1 * Rick Mast 461.1625 463.8875 469.4500 464.4500

450.050 492.887
462.650

Winston Cup Scene 468.650 465.9625

Inside Winston Cup 463.2625

Note: If whoever is covering the race is not on the above frequencies,
try using the search function on your scanner between 450.00 and 470.00
at air time.

Frequencies in the 450-470 MHz range are usually paired in the
following way:

o channels between 450-455 MHz are paired with channels 5 MHz
higher (455-460 MHz).

o channels between 460-465 MHz are paired with channels 5 MHz
higher (465-470 MHz).

To save on space, only one half of the frequency pair is listed.
So, if a station is listed on 461.300 MHz, try listening on
466.300 MHz also.

The following is a copy of a frequency list sold at the NASCAR race
this past week in New Hamshire (I think that is where it was; my sister
and brother-in-law attended and borrowed my scanner.)

I have no idea of the validity of the list for the race since I wasn't there
and suspect most of the frequencies will change by the next race. But,
here goes anyways.

Winston Cup Series

Car Driver Frequencies
--- ------ -----------
1 Rick Mast 461.1625 463.8875

3635. State Police Extender Freqs

Newsgroup: rec.radio.scanner
Date: 1994-05-11 04:00:06 UTC
From: kspain@huey.cc.utexas.edu
Message-ID: <2qpl87$if0@huey.cc.utexas.edu>
Source record: 274482

Anyone happen to have a current listing of all state police handheld extender frequencies (the ones used to xmit from the patrol cars to the portable units). I've got a listing from '90, but it isn't nearly complete and I'm pretty sure some have changed by now.

Is there a publication that might contain the info?

Many thanks.

Kevin

3636. MOD & STEP SIZE

Does the PRO-43 has a "hidden" step size like the BC-2500 or PRO-2006 for the cellular frequencies ? Or is the 12.5 the only step size ?

3637. Re: Rat Shack PRO-2006A

RS PRO-2006 (rats@cbnewsc.cb.att.com) wrote:

: According to a LESCOMM brochere received Saturday, the new PRO-2006A
: scanners have a different microprocesser IC with different pinouts
: from the IC in the 2006, and there is no diode to be had for cutting
: to rcv out-of-spec frequency. So, Rat Shack has killed off a major
: reason to purchase their once-great PRO-2006 series scanner. Let's
: hope that Rat Shack's next super base scanner will be PRO-43 style
: which will be modifiable by relatively unskilled folks...

That's why they had to change the 2006. It was too easy to modify. I have an older one that has been modified and you want to know what? After about a week I got tired of.....well.....you know ;-) and haven't done it since. The unmodified one would be just as good a radio. I'm not wild about the legislation that created the need to redesign the 2006 in the first place but it's not as big a deal as people make it out to be.

3638. Tour DuPont Freqs

Newsgroup: rec.radio.scanner
Date: 1994-05-11 05:55:03 UTC
From: Sherrod.Munday@launchpad.unc.edu
Message-ID: <2qprvn$nlh@samba.oit.unc.edu>
Source record: 274485
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Just had the Tour DuPont finish here in Blacksburg, Virginia, today.
While intending to just listen to local PD reports and glean what I could,
a very nice press guy walked up to me and asked if I had the freqs.

Since I didn't, he gave them to me: there are 6 primary control
frequencies for the control center, and some other units share the freqs
(I hear reports going out in French and another language or two). The
distances are reported periodically as to whwere they are WRT the finish,
time elapsed, etc., and there's enough info talked about to determine
where they are.

Some, if not all these, are repeaterized. There is one airplane which
chases the race: it has the primary repeater. Also, when it goes down for
the day, or isn't there for some reason, at least one of the two "press"
helicopters which travel with the race also has a repeater.

Without further ado:
461.0000
462.2000
463.3250
464.5000
464.6250
450.4125

Also, interesting sidenote: one of my roommates works with the Virginia
Tech Solaray (solar-powered vehicle), and they have two-ways to talk
between crews, etc. They were using them today to talk back and forth
while watching the race, and they found that ESPN control for cameras
shared the same frequency as one of their channels on the two-ways. I
don't know what it is, but they were tempted to break in every now and
then... ;-)

Congratulations Rachel on becoming hooked to the scanning hobby. I enjoyed your article and hope your boy friend will become hooked as well but don't hope that you will fight with him over the scanner <chuckle>

djc@terapin.com Out!

3640. BC100XLT mods going to ftp soon

Newsgroup: rec.radio.scanner
Date: 1994-05-11 07:25:20 UTC
From: Sherrod.Munday@launchpad.unc.edu
Message-ID: <2qq190$oc1@samba.oit.unc.edu>
Source record: 274486
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I have completed a listing of mods that I know of for the Uniden Bearcat model 100XLT, and will be placing it on the ftp servers soon. This scanner is very similar, if not almost identical internally to the Pro-35 from a few years ago, so the information contained therein might be accurate for that scanner as well. Nothing is guaranteed, since I've never worked with the Pro-35.

Two mods are missing from the file: the AM/FM mod (Can't find it in my archives), and the battery mod (it's identical to the BC200XLT battery mod and is not replicated again). All others I've done or know about are contained: if anyone has anything to add, please drop me a line.

I sometimes just listen to the inputs when I only want to hear action in my
area, instead of the entire city. Yes, I know I won't hear the dispatchers,
but if its worth listening, there will be alot of transmissions by the
mobiles/portables, which at that point, I can turn on the bank with the
repeaters.

Maybe I am wrong here but considering how much crap there is in cphone as
opposed to real interesting stuff on the rest of the freq ranges, I could
hardly consider the availibility of unlocking the cphone range to be a "
major" reason for choosing the Pro 2006. This is one damn fine radio folks.
I sure would like to think that your priorities are such that you would
spend $350-$400 to listen to cphone? I hate to flame but get a grip!

The North American version will step at 30 KHz when the cell freq block is
removed.

>Harry
>salvini@wdl.loral.com

Harry,

I believe someone has already put together such a list and includes
it in the FAQ associated with the rec.radio.scanner newsgroup.

However, here's what I know from the 1991 "Listener's Lawbook"
with some changes since then:

Outright bans on monitoring (possession of scanners) in automobiles:

Florida*
Indiana
Kentucky*
Michigan
Minnesota
New York

Florida also bans scanners in any business establishment

Indiana bans portable scanners anywhere except at home or place of
business with some additional specific "exceptions" also allowed,
but none that would apply to the typical scanner "enthusiast"

Kentucky bans scanners everywhere except the place of residence.

Note, that the laws usually do not use the word scanner, but refer
to radio receiving equipment which includes scanners. All

the states listed above provide exemptions to amateur radio
license holders, although Michigan does not include an
amateur operator with a Novice license in that states
exemption.

In contrast several states prohibit the improper use of information
heard, but do not prohibit the equipment and or the actual listening
to police frequencies. They are:

California
Minnesota
Nebraska
New Jersey*
New York
Oklahoma
Vermont
West Virginia

The New Jersey law was changed in 1992 to allow scanners, but
prohibit improper use of information heard.

Note that NY and MN are on both lists.

Hope this helps get you started, and the important contribution you
can make to this information would be identifying those political
entities at lower than a state level (i.e. counties, cities, towns,
etc.) which might have any type of prohibition.

By the way, the author of the Listeners Lawbook is an attorney
and a ham, Frank Terranella. His email address is (was??)

Hello.

Does anyone know how to get pro2006 into 30KHz steps once your are
out of it?

In other words, if you push the step button to change the step
size to something other than the default 30Khz, how do I get it
back to 30Khz step again? The scanner remembers the settings, so
turning on and off the scanner does not help.

Thanks.

> Anyone else have comments?

...once you've used the FCC microfich or the FCC database (not the stuff compiled by Bearcat or Police Call) you will realize that their updated books are only updated by whoever calls in the new stuff. At the Hamvention in Dayton this past April, I had occasion to stop by the Bearcat booth and they were demonstrating their new scanner frequency database which was the "latest" edition. I entered Troy, Ohio and the frequencies that popped up had been extinct for at least 3 years since they went to a trunked 800mhz system in 1990. I informed the salesperson that I was mildly ammused that they were not up to date and was informed that the county printout had the trunked freq's listed, however, try as they might, they couldn't bring up the county (Miami) freqs.....The FCC records are the most up to date however they are more expensive. I would expect once the Library of Congress (marvel.loc.gov) gets up to speed, the FCC section will contain frequency listings, right now they don't, but except for the Federal Gov't Allocations it is public record. Incidently all the federal agencies including Military are part of the master FCC index but are considered "CONFIDENTIAL" information and not releaseable to the public, yes all federal and military must submit registration information for any frequencies they use and the location.....

Hit the reset button. As long as you are in the cell band, it will
default you back into 30 KHz steps.

Radio Shack has a cordless phone that scrambles the conversation between the base and handset...I've tried it and it works...you simply cannot understand the conversation on a scanner. It runs about $150.00.

 SLMR 2.1a You, you and you...panic. Everyone else, come with me.

Neither R/S or Grove sell a device that descrambles voice inversion.
The cheapest place I know of is Ramsey, where you can buy the kit and
build it yourself. I bought one where I had to make several modifications
to get it to work and there is still an annoying 3KHz whine. I hear that
they have a newer model out but I remain skeptical about its quality.

Thanks for your reply, Rachel. It made my day. You have a
deliscious wit.

A good place to start for more RADIO scanner info is "Police Call"
which is available back at your friendly Rat Shack.

Tom Kneitel (sp?) wrote a registry of "secret" government
frequencies which is available, among other places, from Grove.
They have an 800 # which I don't remember currently but you
can get it from 1-800-555-1212.

ftp.funet.fi contains a number of scanner and shortwave archives.

For mods oak.oakland.edu is a good source, however they don't
have the Pro-46 mods. A gent was kind enough to send them along
to me. If you want just drop me an e-mail and I'll be glad
to forward it to you. A warning though: While the '46 is
able to be modified to receive cellular, it is not a simple
"clip the diode" process. It involves desoldering and resoldering
surface mount components. It is best accomplished by someone
with a bit of experience in that area.

Best regards,
Charles veith@cherokee.nsuok.edu

3657. Pro-34 mod messed up

I have a Pro-46 and it picks up some cellular bands unmodified. When you say it can be modified, is that so it picks up everything from 806-956mhz? There is a gap in there, I just don't have it memorized.

Not true. Regardless of what Monitoring Times reported, by FCC defintion the PRO-43 _is_ easily modifiable by the end user. So, once the current stock of PRO-43's is sold out Radio Shack will be either replacing it with an entirely new cellular-nonrestorable model or eliminating the diode and controlling frequency coverage thru the microprocessor (as they'll be doing with the PRO-2006).

No where in their manuals, catalogs, invoices, etc does Radio Shack refer to the 2006 with the display on-off switch as the PRO-2006A. 2006A is an unofficial designation created by the hobby community to identify post dimmer switch models.

Because the on-off display switch was such a minor change in the design RS added the "A" designation to the catalog number only (cat. #20-145 for the dimmer switch model; 20-145A for the on-off switch model). The model number itself has always been PRO-2006.

3665. Scanner vs. CB antenna question...

Newsgroup: rec.radio.scanner
Date: 1994-05-12 01:54:50 UTC
From: Dave Shaffer <DCS4@psuvm.psu.edu>
Message-ID: <94131.215450DCS4@psuvm.psu.edu>
Source record: 274516

Here is a question for the techies out there. I had a perfectly good Rat Shack cellular look-alike scanner antenna on the rear window of my car. I was reasonably pleased with the reception I was getting... but I broke the base of the antenna at the car wash. Obviously, I could replace it with a similar antenna or some other scanner antenna. But before I do that, here's the question...

I have a perfectly good CB antenna -- a magnetic mount device -- in my garage that hasn't been doing anything useful for a long time. Is there any modification that could make it useful for the scanner?

I do have a CB antenna -- another magnetic mount -- that I still use every so often with an old CB radio in my car. I tried patching the scanner onto that antenna with interesting results. It seemed to be quite good and vhf-lo and uhf, but not good at all at vhf-hi frequencies. In addition, I tried mounting the Rat Shack antenna mast in the expendable CB antenna base and using that for an external antenna, and it seems to be good at vhf-hi but not much else.

Aside from just experimenting with height, the old cb mast, etc., is there anyone out there with advice on the compatibility of the cb antenna (or base with the scanner mast) for continued use with the scanner? To be honest, this is sort of fun just as an experiment...but I suspect that the components of the old CB antenna base may make it difficult to document just what I could do to increase performance with my homebrew antenna. I'm open to suggestions...

- Dave

Hi all,

Well I have finally decided to buy the pro 2006 this Friday. The last thing I need to know is how I can tell if it is still modifiable. I am in Canada buy the way. I have read that I should look for an "A" and the end of the serial number. If it is a "B", it is no longer modifiable. Do I have it straight???? Has anyone in Canada bought a pro 2006 since the ban in the US? Anyway, thanks for the help in advance.

Many scanners have come and gone in my life since I got my 200XLT. It's still one of the best portables around. It has the basic scanner coverage + 800. What I like most about it is it's priority function. The first ch. of each bank (1, 21, 41, 61,... 181) is a priority and with ch. 1 being highest and 181 being the lowest. It never leaves my car - the best for the road that I have found.

Source record: 274521

This really sounds like a nice product. They faxed me some info today. Any details on what this feature is: "A 2.5 mm phone jack for software control of a tape recorder." This sounds like a contact closure which operates based on what channel is active? I would be happy to be able to selectively activate a second speaker when specific channels + PL/DPL are active...

Can anyone tell me anything about the ScanStar and ScanStar Pro software? I called the sales number, and they can only give me the price. The BBS has more info. Supposedly. Is this sofware supported somehow? Upgradeable from the basic bundled version to Pro version?

Finally, since I have three Macs of various sizes at home, but no PCs, any suggestions on a cheap way to run this package? Perhaps SoftPC on the Mac? Will the Mac serial port talk to the scanner under SoftPC? If I have to buy a computer, plus the 2006, plus the Opto 456, that will start to add up a bit...

Now all they have to add is two-tone sequential tone decoding that the software can interpret and you could do some really interesting remote control applications. I would also be nice if you could at least dump channel setup info into the 2006 in native mode, but you can' have everything I guess.

Of course, the final question is - Does anyone discount the Opt 456, or is this a special intro price that will increase when it hits other sales channels?

Peter

Dave - I've used a CB antenna on my scanner (mainly for cordless band), and
it worked fantastic. However, there are really a few things to keep in mind
(especially true for scanning).

The ability of the antenna to recieve a signal on a given band is determined
by it's length. Higher frequencies require a shorter length. Incidentally,
the antennas designed for CBs are designed for 27 Mhz - very low in scanning
terms. If you open up the base of your CB antenna, you will find a coil - this
is the same as having a very long antenna. For scanning, this coil should
generally be shorted out (or removed and replaced by a straight wire), because
most people want to listen to the VHF (about 150 Mhz) and up bands.

One thing about scanners, though, is that certain models are oversensitive
to strong signals (intermod). The easiest way to solve this is to shorten the

antenna.

In summary, unless you listen to frequencies around 30Mhz, gut out the base coil, and leave the length of the antenna as it is. If your scanner receives intermod, trim the antenna a little. Theoretically the antena lenght should be equal (in feet) to the frequency (in MHz) divided by about 430. I have found in the real world, though that a gutted CB antenna works just great (MUCH better than the fake cellular antennas - they didn't even compare to the CB antenna I used)!

3677. 2026 sale coming up

Newsgroup: rec.radio.scanner
Date: 1994-05-12 06:52:14 UTC
From: boothc@kenyon.edu
Message-ID: <1994May12.015214.11952@kcvax1>
Source record: 274434

Well I went down to RS today to get my Beyond Police Call, which they didn't have, and found out that the 2026 is going on sale soon for $175/185 from $240 (I think?) during their next sale period whenever that is Any way it will be a subtantial sale. From the looks of it, this would make an excellent mobile scanner. I think it's only 2x conversion, so perhaps intermod=not worth it. I don't know I went from a pro-41 to 43 so I don't have all that much experience with the stuff in between that rs offers. No I'm not going to bitch about the fact that the local RS doesn't have BPC cause they're not company owned and actually carry a nice selection of other stuff and occassionally have their own sales and cut me a nice deal once. Even told me that they had considered doing the 1-800-discount thing, but they didn't think they would make all that much cash. So, they sell 15 inch knives to overgrown 15 year olds to play with.... I wish they at least had assault weapons s/t like 7100 rounds a minute? Or was that assault radios.

But it still is odd. He said they would be in next week. (2 weeks late...:(I'm curious to see it.....

3681. frequency counters

Newsgroup: rec.radio.scanner
Date: 1994-05-12 13:44:28 UTC
From: Mike_Cook@walnut.prs.k12.nj.us
Message-ID: <1994May12.094428.881191@walnut.prs.k12.nj.us>
Source record: 274437

After the responses I got concerning Frequency counters I have decided definitely to get one. I also decided not to get the Radio Shack model. Now I'm deciding between the Optoelectronics 3300 and a FC-1200. Does any one know any thing about the FC-1200 in "Alfa Electronics" catalog. Its the same price as the 3300.
Any thoughts would be greatly appreciated.

I have to agree with Carl. While I don't think any freqs should be banned,
cellular monitoring is only a very small portion of the hobby, but it seems to
be peoples primary consideration when choosing which scanner to purchase.

I have heard, but not seen for myself, that there are no diodes in the new 2006
corresponding to the ones in the modifiable 2006. If this is true, you should
be able to tell whether you've got a new one or an old one without doing
actually doing a mod.

3686. Alpha paging software for Macintosh

Newsgroup: rec.radio.scanner
Date: 1994-05-12 16:54:58 UTC
From: chinatti@tucson.Princeton.EDU
Message-ID: <1994May12.165458.12879@Princeton.EDU>
Source record: 274436

I was wondering if anyone knew of any (or has) alphanumeric paging
software available for the Macintosh. This software works with a
modem and dials up the paging carrier's computer and enters the
message.

Thanks in advance,
Steve

3689. Re: 2026 sale coming up

Newsgroup: rec.radio.scanner
Date: 1994-05-12 18:06:14 UTC
From: ksmith@theodolite.ae.calpoly.edu
Message-ID: <2qtr6m$55q@babyblue.cs.yale.edu>
Source record: 274448

I bought a Pro-2026 from MaryMac on sale for $125 about a year ago, and it's aboslutely the WORST radio I've ever seen. I'm running it mobile, in what I think is a pretty small town (40k, college community), which would lead me to believe metropolitan areas would be worse. This thing is RIDDLED with intermod. I'm using a bad antenna (the AM/FM whip on my car, split to the scanner and stereo), and the intermod is intolerable. Running with an outside real antenna makes the problem much worse (obviously). I don't seem to have too many problems with VHF-Hi, but UHF gets hammered by paging and data.

My advice would be to steer clear of this scanner at all costs. It's the only thing that fits in my car, so I'm stuck. My only other option seems to be getting a Uniden Bearcat BC-760XLT, which seems to be the same scanner, and using the PL board to at least mute the thing on intermod. Unless I want to spend $1,000+ for a Pro-2006 w/this new Opto control board and a dash-mounted palmtop for control (sounds neato, but expensive).

-Kirk J. Smith, KD6RCT

453.550MHz, DPD "Channel 5," is used for special events, but
is normally a simple "repeater" channel for units to communicate
with each other or with precinct desk off of the normal district
dispatch channels.
I have occasionally heard DPD special events communications on 453.875.
The book which has been referred to in other posts,Scanner Frequency
Directory for Northwest Ohio and Southeast Michigan
by Darryl Symington -Radio InfoSystems,is indeed an excellent reference.

Here's the APD freqs:

460.400 Frank sector (APD channel 1) - Southeast Austin
460.100 Adam sector (APD channel 2) - Northwest Austin
460.450 Baker sector (APD channel 3) - Central/West Austin
460.325 Edward sector (APD channel 4) - Northeast Austin
460.175 Charlie sector (APD channel 5) - East Austin
460.275 David sector (APD channel 6) - Southwest Austin
460.025 Info/Tac (APD channel 7) - Info / Tactical - Citywide
460.500 Info/Tac (APD channel 8) - Info / Tactical - Citywide

155.580 Univ. of Texas P.D. - (I haven't confirmed this freq...)

155.370 DPS Austin (Trunked system so you'll only hear the dispatcher)

Hope that helps!

: Can someone please e-mail the frequencies for the LA area? Thanks in
: advance!

Geesh, lots o frequencies in the L.A. area. If you have the availability
to dial up local BBS's, you should find a program called scanman. It
contains all the usefull freqs for So Cal. The other alternative is to
go to a ham radio shop and get the latest copy of the local police call
book. It is not the one that radio shack sells but rather a crude
looking but greatly detailed paper bound book. costs around $10

My circumstances are almost identical. I bought the 2026 from Marymac
about 15 months ago, & it is installed in my car, tapped into the AM/FM
antenna.

I'm often driving around in moderate RF environments, such as Ann Arbor,
& freqs programmed into the 2026 run the gamut from VHF-low band to 800MHz.

My opinion of the 2026 differs, though. For $125, it is a great scanner
(I certainly wouldn't pay around $200 for it, though). I don't get a lot
of intermod, but when it does get it, I know that really any other
single-conversion scanner would also probably get it. My biggist
problem is with a few VHF frequencies in the 155MHz area which get
aircraft images. It also seems to have birdies (or perhaps it is just
EMI from the car) on a few active freqs like 156.150 & 155.370.

>My advice would be to steer clear of this scanner at all costs. It's the

I've had the 760XLT with CTCSS in my car too. If every freq you want
to monitor runs CTCSS, then maybe the 760XLT will work out for you.
Otherwise, I'd suggest a good handheld like the PRO-43.

> I have occasionally heard DPD special events communications on 453.875.

When there aren't any 'Special Events' going on, traffic on 453.550
is pretty mundane -- cars talking back to the desk officer at their
precinct (normal dispatches are done by a central dispatch point) to
order a tow truck for a recovered UDAA, etc. During a major event --
barricaded gunperson, Freedom Festival, Powerboat races, DeeTroit Gran
Prix, etc. the channel is run by the DPD Command Center for police ops
relating directly to the special detail.

The reason I didn't mention the routine traffic on Ch 5 to the
guy is because he mentioned that he'd be coming in from out of town, &
wanted to monitor some of the GP PD traffic...

453.875MHz is the DPD Tactical Services Section channel. During
major events, most of the TSS units would be deployed, thus increasing
the amount of traffic on their channel, as well as some of them being on
453.550.

3699. IL HB4180 Update

Newsgroup: rec.radio.scanner
Date: 1994-05-13 00:02:10 UTC
From: Ted Moran <Ted.Moran@f747.n115.z1.fidonet.org>
Message-ID: <768769330@f747.n115.z1>
Source record: 274447

In early April we were notified of the existence of IL House Bill 4180. This Bill, sponsored by IL. Rep. Tom Cross from Yorkville, would have effectively banned the possession of any scanner powerable on DC current by hobbyists.

We attended a House Judiciary Panel hearing on the matter. We appear to be making quite a bit of progress with the bill, at least in terms of getting it re-drafted along the lines of the Chicago City law. That law makes it a crime to use a scanner to aid or abet the commission of any other crime. We feel we could fully support such a statewide measure, and would be happy to assist Rep. Cross with getting it passed into law.

Rep. Cross's office continues to assure us that we will see the re-drafted version of the bill before he sends it back to the panel for final review and that it won't be forwarded without our okay. There has been a very lengthy delay with getting the bill re-written by Rep. Cross's office. This delay is currently being attributed to the resignation of 2 of his staff members.

We remain concerned over any possibility of the bill passing in it's current form. Until we see the new version we can't support it. While we don't want to overload Rep. Cross's office with mail and bad press, we do think it's important to keep this issue in the light of day. If you wish to voice your concerns you should contact your Illinois State Representative. Rep. Cross may be reached at;

541 Countryside Shopping Center
Yorkville, IL 60560
(708) 553-0000

We would like to see the bill re-drafted, making it a crime to use a scanner to aid the commission of a crime. We think this would actually help the hobby's public image. We would welcome the opportunity to support such legislation. We will present further details at the CARMA meeting. If we do get to see the re-drafted version we will post it on the CARMA BBS, (708) 852-1292, as soon as possible. We'll do everything we can to keep you posted. The current status of HB4180 may be checked by calling the clerk's office in Springfield; (217) 782-3944.

We will also post the new version of the bill here as soon as we see it. Ted Moran / Chgo Area Radio Monitoring Association.

Source record: 274380

It is not legal to listen to police and other public safety transmissions in the UK. However, in reality,unless you scan publically, publish frequencies, divulge message content or show up at a police action with a scanner- no one is going to bother you. Since you'll be using a Pro-2005, I can assume that you will using mains [house] current-unless you plan to run mobile off a car battery. In a private home- no problem. In a hotel- don't leave it out when you're not inb the room. Thew UK band allocation is compatible with your Pro-2005 except for the European low band which replaces our 30-50 MHz with 66-90 MHz. Most, but not all of the public service transmissions found in this area will be repeated in the 150's. I can provide you with more specific London frequencies if you let me know when you're going. Drop me a note at 456 Barrymore Place North Brunswick NJ 08902-2604.

Sorry, I tried to post this last night, but the local news poster couldn't
talk for some reason with the net feed to post my note.

I put it at oak.oakland.edu in the directory of
pub/hamradio/mods/uniden/bearcat with the filename of bc100all.mod

Hope this helps, and sorry for the delay (would've told you yesterday, but
like I said, the poster wouldn't post my note).

Enjoy!

Sherrod

Does anybody out there know of any single channel receivers that run off of crystals? (ie scanner crystals) Preferably something cheap. Kits are fine.

I am very involved in Fire, EMS, ARES, etc. and I need to monitor several freqs at once. I want to set up a unit that can receive all the freqs I need without scanning, that way I don't interfere with one or another freq.

I've seen Ramsey's receiver kits, but I'm afraid that they would somehow become "untuned" if they got moved around, or a little cousins hand found the knobs, etc. I would like something that I could just pop the xtal in and be pretty much set.

Thanks and '73!

Matt

I think Radio Shack sells a single crystal unit. Also, there is the AOR AR33
which is a very fine thumb-wheel tuned vhf receiver (hand-held).

Sounds like you may have a defective cell inside you nicad pack. I had
same symptoms on a new radio I bought (not Relm) and battery usually last
about 15 minutes then died. Is your battery pack also heats up when you
charge it? This will also indicate bad cell/s inside. I found out because
instead of sending it back I open it up and measure individual cells and
found a dead short on one of the cell.
good luck

>This brings up a question: Is it ok for me to transcribe these freqs on
>here? I don't want to break any copyright laws, but I find it hard to
>believe that you can copyright frequencies. Is it ok?

Factual data can not be copyrighted, although the way it is
arranged/presented may be protected by a copyright if that
presentation reflects sufficient creative originality.

Thus, the fact that Penske Racing Team uses frequency XXX.YYY
is not protected by any copyright anymore than the fact that
my amateur callsign is K2UNK and I live at such and such address
or that your name is James Ziogas and your internet address
is jim2@infinet.com.

The US Supreme court ruled on a similar situation involving
telephone books and found that the data in a phone book is
not copyright protected because it is both factual data and
the specific arrangement in the phone book (alphabetical) is
not creative or original in terms of copyright protection.

The fact that someone may have put in a great deal of research
or time to assemble a database of factual information ("sweat-of-
the-brow" effort) does not automatically provide a basis for copyright
protection unless the presentation of that data (the arrangement)
can be shown to reflect some degree of creativity. As per
the above, simple alphabetical and/or numerical data sorts
have already been viewed by the court as not be protected on
the creativity/copyright basis.

Standard Disclaimer- Any opinions, etc. are mine and NOT my employer's.

>mast in the expendable CB antenna base and using that for an
>external antenna, and it seems to be good at vhf-hi but not much
>else.

If the above is saying that you had the antenna connected to
the CB and the scanner at the same time, that could be a problem

>Aside from just experimenting with height, the old cb mast, etc., is
>there anyone out there with advice on the compatibility of the cb
>antenna (or base with the scanner mast) for continued use with the

>I suspect that the components of the old CB antenna base may make
>it difficult to document just what I could do to increase performance
>with my homebrew antenna. I'm open to suggestions...

Any antenna for scanning is always a compromise as what you are
attempting to do is receive from 30MHz up to 500MHz or higher.
That's a very wide spectrum representing radio wavelengths of
10 meters down to < 60cm. I suspect there isn't anything other
than the length of the CB antenna (might include a coil in
the antenna itself to electrically length the antenna) that
should be any problem as a receiving antenna.

Experiment with it as you've already started to do.

Alternatively, you might just try a straight radio recieving
antenna replacement as found in K-Mart, etc.

Good luck,

Many people have set up World Wide Web, Gopher, and other systems
which have pointers to the Boston Amateur Radio Club's FTP area.

This is very much appreciated.

Problem is, some of these pointers still point to the club's old location of
world.std.com, now known as ftp.std.com.

Could the people who maintain the WWW and Gopher systems (and others I am
not aware of) please make sure your pointers for the BARC's FTP area point
to oak.oakland.edu, /pub/hamradio directory.

Otherwise, those who wish to access the site will not be able to with the
present configuration.

Thank you very much.

73,
Scott

Sorry, I tried to post this last night, but the local news poster couldn't talk for some reason with the net feed to post my note.

I put it at oak.oakland.edu in the directory of pub/hamradio/mods/uniden/bearcat with the filename of bc100all.mod

Hope this helps, and sorry for the delay (would've told you yesterday, but like I said, the poster wouldn't post my note).

Enjoy!

Sherrod

--

\ The above does not represent OIT, UNC-CH, laUNChpad, or its other users. /

To hopefully prevent ANY confusion, Sherrod actually placed the file into the /pub/hamradio/incoming directory. I then moved it into the bearcat directory.

The /pub/hamradio/incoming directory is only writable by arrangment by me.
All other directories within the /pub/hamradio area are read-only.

I also own a pro-2026. I think that it is a fine scanner. I use it mobile with an antenna specialist wide band mag mount and only occasionally do I recieve intermod mostly from paging systems. I'm in eastern Mass near Boston and there are plenty of high powered transmiters in the area. I've been quite pleased with the unit and it's performance.

The other one is major isn't it as in 'trunk road'?

Timothy,
thanks for the reply. I'm sure some other techie types coould answer the
scanner/computer interface Q, I have only read about some for my Radio Shack
2004.

the Boot quote bring back memories of my old unreliable love, a 60 Triumph TR3.
Trunking is a way of maximizing radio frequencies by utilizing a dozen or more
channels, and a computer controls which freq is used when the user keys the
microphone. Utterly challanging to monitor, for the radio traffic never seems
to stay on the one freq. Then you have ALL the city services, police, fire,
public works, bus drivers, trash collectors, etc on the system, trying to
listen to a fire in progress will be interrupted by the manhole cover polishers
or whutever.

Starskey and Hutch was a 70's police drama. I remember having an old crystal
controlled Radio Shack 4 channel scanner then, and it was the exact same radio
that they used for a 'prop' on the show......

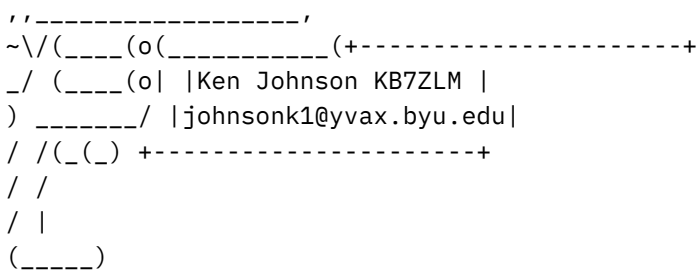
3731. Scanner antenna recommendations wanted

Newsgroup: rec.radio.scanner
Date: 1994-05-13 21:36:59 UTC
From: johnsonk1@yvax.byu.edu
Message-ID: <1994May13.143700.7757@yvax.byu.edu>
Source record: 274383

Now that I have my new Pro-2006 figured out and about half of the channels programmed, I'm interested in the possibility of getting a better antenna. I live in an apartment, and would have to mount it on the balcony. Also, I can't spend too much (I had a hard enough time justifying the scanner itself to my wife). Any recommendations? What models are available, and how much will it set me back? Would a small, inexpensive exterior antenna improve my reception enough to make it worth it?



3732. Beyond Police Call

Source record: 274385

Hi everyone. I've been following this thread for about 4 months and I havn't posted a thing, so now I'm glad I have something to say.
I just bought the new Beyond Police Call from the Rat Shack. Nice book, very in-depth listing for each state. I found 11 pages on Minnesota alone. I found frequencies I never imagined finding (ie. Private Investigators).

I'd suggest picking up a copy if you're looking for a change from Police, Fire, Medical, etc. My 2 cents... Thanks,
-Joel

3733. Need help with my new 2006!

From: bobwx1@nbnet.nb.ca
Message-ID: <bobwx1.8.0@nbnet.nb.ca>
Source record: 274386

Hello,

Well I just did it! I bought my new pro 2006. It did not have a "B" at the end of the part number but it did have a "B" at the beginning of the so-called DOC (dept. of communications in Canada) number. The salesman at RS assured me it was modifyable to get the cell range. How do I know if the modification is the old one of clipping the diode or not? I have opened it up and the diodes are in fact there but I don't know if I will still get the cell range by clipping them. If it is the newer version that has the processor, how do I know? Where is it located and how do I identify it. By the way I read on this list that you could tell when the scanner was manufactured by a sticker on the back. My says 12A3 which means Dec 93 I presume. I did not want to clip the diodes for nothing since it would not be returnable if they were clippped. Please help me.............

Sounds like it's warranty time. BEAUTIFUL doesn't cut it, if it don't work! Seriously, if you aren't equipped to check it out fully, and it's new, you ought to return it. Or take it to a local radio shop for a check out. Might be hard to find a shop who will deal with a RELM, so you might need the shop manual if you go that route. Good luck.

Hello,

I grew up in dearborn, but left 3 years ago for sunny south FLA.
anyway here is a GOOD freq for Dearborn PD undercover 156.210 or
156.150 one of the two. main dispatch is 158.???? . As for Detriot
they are in the 453-454 band if I rember right. Also Intercity freq
is 155.370 this is all from memory but I think i'm right I hope this
helps.

p.s. STAY OUT OF DETRIOT AFTER DARK

I don't know what the problem is with your 2026 because I've had mine since the day it came out and I love it.. I live in Fort Lauderdale and regularly drive with it to Miami (both heavy RF).. I have a 5/8 MNO mount 2m antenna on the mobile I use for it.. I have only had problems with the 2m band sneaking up into the federal vhf band.. The cell restore was simple, and it even seems to help keeping the cellular images out of the rest of the 800 band. I think you got yourself a bum scanner. I also have a few friends with the same radio and everyone is very happy with it. Have a qualified person look at it.. Definately not a design problem.

Steve KE4GFF 7 year scanner freak.

If you're that dead set against it I've got $50 sitting here for it!

Is this the same MT which announed early last fall that the PRO2006 was
being discontinued and replaced with the non-cellular restorable PRO2007,
and that Grove Enterprises had bought the remaining supply of PRO2006
scanners from Tandy? And is this the same Grove Enterprises which
characterized the announcement as "premature" when I called to ask them
about it? Maybe they should start slipping little salt packets inside
those new MT plastic baggies to remind readers to take a few grains
with each article.

Greg

: wrote:

: > Can you sell a used ICOM 7100 which does receive Cellular Frequencies eventho
: > it is against the law to listen ?
: >
: > Thanks ?

: I just took delivery (purchased) in ICOM 7100 on 5/6/94 which was after the
: 4/26/94 cutoff date. From what I've read and been told, only the
: manufacture or importation of the ICOM 7100 or similar units was prohibited
: after 4/26/94. For those of us that own scanner capable units, the price
: should now appreciate in the used market. The dealer that I purchased my
: ICOM from told of an incident where one of the ICOM handheld cellular
: capable units was bought recently at a significant premium over its
: original price.

Not entirely true. The U.S. Customs still only requires FCC form 740 for
importing ANY non-certified device. This means that even though congress
passed a law making it illegal, there is no teeth in the law to enforce it.
I know, I have seen posts on other systems and received mail of people who
have purchased NEW units from Canada, Germany, and the U.K. as recent as
this past week -- which is definately beyond April 26. They had no
problem in obtaining the equipment.

In addition, Opto-Electronics in South Florida have started making a
add-on for the Pro-2004/5/6 scanners to _override_ the new blocked-in-CPU
versions which controls the scanner via rs232 from the computer.

This new hardware will electronically replace the CPU with it controlled
by non-regulated software. I hope they do this for more of the scanners.

Since the FCC does NOT regulate (1) software, (2) materials (such as
semiconductors and kits), and (3) an add-on does not constitute a finished
(ie, manufactured) product, there are ways around the boneheads in DC.

This is for a friend of mine.

For sale Realistic PRO-2022 scanner with the following features:

Frequency coverage - 30 - 54 MHz
108 - 136 MHz
136.005 - 174 MHz
380 - 512 MHz
806 - 960 MHz

Radio has been recently modified for cellular reception.

2 second scan delay
Selectable priority
Battery backup
Search function
10 monitor channels independent of the 200 scanner channels
Individual channel lockout

Radio is in an excellent condition, hardly ever used. My buddy bought it
about 3 years ago and used it for a total of maybe 2 hours.

Best offer takes it. I'll consider any offers.

> minds want to know!

Monitor America covers a smattering of Public Safety and "special interest" listings for each state and major metro area. BPC is non-public safety non-aircraft non-rail listings (ie anything not in Police Call) for the whole country.

Beyond.. has no maps, codes, unit numbers, callsigns, PL tones or any of that stuff. Basically, Monitor America and Beyond Police Call are directed at different audiences.

And, Yes, Rich Barnett did edit BPC. BTW, I was the Upstate NY co-editor for Monitor America. And I am +highly+ impressed with Beyond Police Call. There aren't many scanner books that I will shell out for any more. I bought a copy of BPC. Rich and Co do nice work. :-)

From: danbury@BIX.com
Message-ID: <danbury.768938125@BIX.com>
Source record: 274402

When I listen to my Uniden Bearcat BC-55-XLT I hear
some really garbled sounds.

When I turn the volume control knob way down, and put the
speaker right next to my ear, I can hear the thing clearly.

Is this a defect ? Are the batteries weak ? I just put new
batteries in there a month or two ago, and since that time
I'm certain that they haven't had a hour's total use.

The one important feature missing from the SoundBlaster (& Pro) cards
is the ability to do full-duplex audio. The card can either play or
record, but never both at the same time. This makes it useless for
doing anything in "real-time".

This brings up a big question - are the Opto folks going to release
interface programming protocols? Or do you HAVE to use the PC based
software (ie, can't roll your own...)

>
>I'm going to return it, if I don't get better signals.

I drove around for a week once with my ATT switch set to 10dB.
I thought the problem was with the antenna, because I knew how
sensitive the Pro-2006 is. If that is not your problem, you should
return it and get another 2006, not another scanner.

This week I am returning an Icom IC-R7100 because, side by side with
my 2006, it gravely disappoints me. I liked the seek and store feature,
but I can get that for more than a thousand dollars less.

To me, the 2006 is like what my teacher said of Shakespeare: if we
don't like him, the fault is ours, not his.

So I say, maybe something is wrong with that one unit, or maybe the
ATT switch is on 10dB, but please do not abandon the 2006 as a whole.

I am reminded of a quotation from Bob Parnass, in a comparative review
he wrote about the Icom R7000 and R7100:
"For fast, reliable scanning, you still can't beat a PRO-2006."
If I had heeded his words in that sentence, and stayed satisfied
with my pro-2006, I would not have ordered the R7100.

I like a scanner that I can operate with my eyes closed.

Could someone suggest a good companion scanner to the PRO-2006, one
that complements it by providing the seek and store that it lacks?

Also, I didn't notice a way to order the new Opto 2006 controller.
How do computer controllers broaden a scanner's features?

And what does one do about radio interference from the computer?
I can't scan 30-50 Mhz when my computer is on, but I want to use
my computer for logging and sorting frequencies.

Is Grove's Innova Powerpak the best source of portable 12 volt power?

When asking for the latest version of the M-400 Universal Decoder, how
do I reference the latest version?

Please email me or, if the answers might benefit many, post here.

Thanks to all who have helped me by posting here.

3760. twinlead J pole antenna general calculations (basic program)

Newsgroup: rec.radio.scanner
Date: 1994-05-15 07:06:08 UTC
From: wa2ise@netcom.com
Message-ID: <wa2iseCpu128.39v@netcom.com>
Source record: 274416
Cross-posted to: rec.radio.amateur.antenna,rec.radio.scanner

This is a short basic program for calculating required lengths of twinlead J poles for other VHF and UHF bands. This worked on an IBM PC clone with MSDOS 5.0's QBASIC. Now you can make a Jpole for something else than 2M! Or you can just walk thru the equasions with a calculator and pencil and paper. The twinlead I used matched the "PVC tube" figures, maybe the wooden stick I used to hold it had some effect. Antenna works well.

Recently I have purchased a new Scanner which was supposed to be an AR-1000xlt, but they sent me a Trident TR-1200. At first I thought tehy were different but the manual is exactly the same except for the first and last pages, all the other pages refer to the AR1000. It seems to be programmable the same way the AR1000 is. So my question is does anyone know the difference between the 2 scanners? Any help would be appreciated.

Kevin...

DOES ANYONE HAVE THEIR PRO-2006 RUNNING BY A COMPUTER INTERFACE?
IF SO , WHAT KIND OF NEET STUFF CAN YOU DO WITH IT?
WHAT IS INVOLVED TO CONVERT YOUR SCANNER?
I AM THINKING ABOUT HAVING IT DONE! SHOULD I??
ANY COMMENTS.

THANKS IN ADVANCE
RLING@CAD.UCCB.NS.CA

In article <2r495b$gnu@strauss.udel.edu>, kmorrill@strauss.udel.edu (Kenneth J Morrill) writes:

Thanks Kenneth for your help. However, I adjusted the ATT switch and still find it less sensitive. I'm speaking primarily with the aviaition band - 118.00-136.00. While I believe it's a great scanner it just doesn't perform as well as my other scanners, and that's what I need performance. I could care less about all the search and store features. My other scanners are: RS PRO-2001 and the Bearcat 205XLT. The Bearcat stomps all over it and the old reliable 2001 is the best base unit ever made, in my opinion.

3766. bc200xlt reset

You can reset the bc200 by pressing the [MANUAL] [2] [9] keys and then turning on the radio. You can also set the radio up with some factory test frequencies by pressing [SCAN] [2] [9] keys and the turning on the radio.

BR> clippped. Please help me.............

Bob...Just clip the diode behind the keypad. The diode is behind the
number 3. Clipping the second diode close by will enable 30 cps scan rate
instead of the 26 cps the radio is manufactured as. There is no ill
effects clipping the second diode.

SC> From: skical@aol.com (SKI CAL)

SC> I just bought a RS Pro-2006. So far, I'm dissapointed with the
SC> performance of it.
SC> My hand-held scanner picks up reception of weak signals better.

SC> Has anyone else out there experienced similar problems?

SC> I'm going to return it, if I don't get better signals.

The 2006 is known to not be as sensitive as other scanners. This is a good thing/bad thing. The good thing is that the scanner is not plagued by intermod as other scanners can be. The bad thing is what you described.

The 2006 is a star performer. You may want to try an external antenna to see if that will help.

Also, BE SURE that the ATT switch behind the scanner is NOT set at 10. The switch should be set at 0. If set to 10, the unit will not pick up weak signals.

E> three times, but it keeps disappearing on me!!! So here comes that
E> question again...

E> Does anyone know how to reset the BC200XLT so that all banks are cleared?
E> Leaving the battery disconnected for extended periods doesn't count...

I believe that you have to press MAN, 2 and 9 at the same time while the
unit is off, then turn the unit on. This will clear all of the channels.
SCAN,2,9 then turning the unit on will load 20 preset freqs.

Not mine. I had to snip a diode to receive cellular activity. It was
blocked out before I made the mod. When did you buy your 2022? Maybe
some of the earlier ones came ready for cellular. I bought mine when
they were closing out that model.

Scanners manufactured by Nissei are sold under many different brand names
(AOR, Camnis, Trident, Fairmate, etc). Since ACE Communications lost the
right to sell the AOR brand, they are now selling Tridents.

How can you tell a new (unrestorable) Pro-43 from an old (restorable)
one? Is there a different part number or something, or do you just
have to find the serial number cutoff? For what it's worth, my Pro-43
(S/N 07422x) is restored and works fine?

Hello all,

Recently I saw an ad in one of the hundreds of scanner/ham radio magazines I subscribe to for an inexpensive (around $29.95) discone antenna. However, I cannot seem to find the ad after many hours of looking. Since I am looking to purchase five of these antennas, I would like to find the best deal possible.

If anyone knows of a good source for inexpensive discone antennas, I would appreciate it if you passed the information along to me at: asplund@aludra.usc.edu.

Thank you for the help.

The 2006 that is NOT cellular restorable won't have the diode.

Go ahead and clip it. Don't remove the diode just clip it once where the diode lead curls up and over like the end of a paper clip. If you ever need to return the radio just resolder the clipped lead. I did it once when I had to return my 2004 for service not connected with the clipped diode but RS replaced the diode anyway and I simply clipped it when I got the radio back.

>I was wondering if anyone knew of any (or has) alphanumeric paging
>software available for the Macintosh. This software works with a
>modem and dials up the paging carrier's computer and enters the
>message.

There is a 100 page or so information booklet available from Motorola
that lists just about every software package that talks to alpha
pagers. The broshure is called "NewsStream, NewsCard, Third Party
Referral Guide To Alpha and Data Paging" , dated 04 March, 1994.

The phone number given is 1-800-542-7882, but I'm not sure if that's
the correct one to order a broshure. Rumor has it that you have to
ask for the broshure exactly by name, or the operator doesn't know
what you're talking about. The guy who appears to be in charge of
maintaining the data in the broshure is Rob Lockhart, Resource
Manager, Interactive Data Systems. His internet address is
Lockhart-EPAG06_Rob@Email.Mot.Com.

A quick look at the Mac page, shows the following programs:

PagerPRO and NetWORKS from Caravelle Networks Corp.
U-Page, U-Page Pro, and QM-MailBeep from Desktop Paging Software, Inc.
ALFIE-Jr./Mac from EVTEK Corp.
Notify! and Update! from Ex Machina, Inc.
AlphaPage MAC and AlphaPage MAC LAN from Information Radio Technology, Inc.
McPAGE from Metriplex, Inc.
Pop-Page from Statistical Control Systems Corp.
QM-PAGE and QM-PAGE SD from Wolf Creek Technologies, Inc.

All standard disclaimers: I've never seen any of these, I don't own an
alpha pager, and I hate Macs. :-)

The Innova Power Pack: I have 2 and a friend has one.. We both HATE THEM! There is a board inside that controls charge rates and it doesn't allow the battery to reach a full charge. The power module also requires REALLY CLEAN DC or else all 3 lights go on and nothing happens. We ended up taking out the Rocket 6.5 ah 12v gel cells and using them with constant current chargers (12v wall adapters, low current). Everything is fine now. Unless these guys have changed the design, get a gel cell and save a bunch of money.

I also bought mine when they were closing it out. On Oct. 10, 1993 to be
precise. Knowing how noisy I am, the manager told me about it and that
they were no longer being made. Just don't ask me how I know that you can
receive cellular activity!

The PRO-43 steps through the cell range at 30kHz. What I don't like is
that it steps through the 894-896 airphone range at 30kHz too, when the
proper step size is 6kHz. Other than that, good radio.

I just received a catalog from the Tele Path Corporation - they deal
in used vhf/uhf commercial gear. Give them a call and explain your
needs; their prices are very reasonable.

Example: Motorola Mocom 70, 450-470 mc, $19 each (5 or more).

Other Moto goodies: Syntor, Spectra 900, Mostar, MTX handhelds,
Syntor X and X2, Traxar, STX handhelds, Spectra, MCR/MCX 100,
Micor, Mitrek, Flexar Base, Mitrek Base, Mocom 70 Base,
Micor Repeater, MX 300 handheld, HT90/450 HT, HT600/P200 HT,
MT1000 HT, Saber HT, P100/HT50 HT, MT1000MVA, Pulsar.

I won't list the GE, Johnson, Uniden, and RCA stuff.

Accessories include cavities, duplexers, isolators, combiners, tone
boards, amps, repeaters; also a 30,000 tone reed and TCXO bank.

Their telephone number is 800-292-1700 (Calif: 510-656-5600);
address: Tele-Path Corp.
49111 Milmont Drive
Fremont, CA 94538

They say, ``Thousands of used and reconditioned mobiles, bases, repeaters,
portables, pagers and mobile telephones... We take trade-in equipment...
Technical support.''

Disclaimer: I have no business interest in Tele-Path and have never
bought any item from them. I just have fun browsing through their
catalog.

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part in bulletin boards, networks, or publications which charge for service without permission of the author. Free distribution is encouraged.]

This introduction is intended for people new to the scanning hobby and is oriented to scanning in the USA. It tells where you can buy your first scanner, what features it should have, where to get it repaired if required, how to get frequency information, and mentions a few scanner clubs worth joining.

Why Scanning?

Every day and night, scanner hobbyists are entertained by what they overhear on their radios. Police cars, fire engines, ambulances, armored cars, trains, taxis, airplanes, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss strategy with his advisor from a 415 MHz radiophone in Air Force 1, or a team of G-men protect him while transmitting in the 167 MHz range?

Listen in the 46.61 - 49.97 MHz range to your neighbors deal drugs over their cordless telephone, or as their conversations are picked up and transmitted over the airwaves between 49.67 and 49.99 MHz by their sensitive baby monitor intercom.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots.

Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

You can even listen to the order taker's wireless microphone at the local McDonald's restaurant on 154.6 and 35.02 MHz!

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the ECPA. Change is in the wind -- it will soon be illegal for companies to sell scanners which cover the cellular phone frequencies, but sales by private individuals will still be allowed.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have recently enacted laws against listening to cordless phones, but it's currently legal to listen in most states. You can find out about these restrictions in a 39 page paperback, ANARC Guide to U. S. Monitoring Laws, compiled by Frank Terranella, available for $7.50 from ANARC Publications, P.O. Box 462, Northfield, MN 55057.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners bear the Realistic label but are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend AOR brand scanners.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you

get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners almost always provide more audio than portables, and portables are usually more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band unless you live in a very rural area where this band is not used. Usage of the 800 MHz band is growing by leaps and bounds.

If you're not sure whether you'll like scanning, don't want to spend much money, a 16 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting

From: <>
Message-ID: <2BB96140@stormbbs.dmc.com>
Source record: 274344

coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often poor.

Deluxe scanners can be controlled by a personal computer, although this feature isn't important to most scanner owners.

Currently, the more popular scanners include the Uniden/Bearcat 760XLT (a/k/a 950XLT) and Radio Shack PRO-2006 base/mobiles, and the Uniden/Bearcat 200XLT (a/k/a 205XLT) and Radio Shack PRO-43 portables.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so. Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801, can extend reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be somewhat more prone to lightning strikes because they are not at "DC ground."

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores like Service Merchandise and Circuit City sell scanners, but carry just a few models. Department stores, like Sears and Montgomery Wards, sometimes offer scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 300 S. Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- National Tower Company, PO Box 15417, Shawnee Mission, KS 66215. Telephone (913)888-8864.

- Marymack Distributing (Katy, TX) sells Radio Shack scanners at discount. Telephone (713)392-0747.

Many ham radio dealers, like Amateur Electronics Supply (Milwaukee, WI, (800)558-0411), also sell scanners.

Used scanners may be found at hamfests, flea markets, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

If you are handy with a soldering iron, you may be interested in modifying your scanner to add features or enhance its performance. Be warned this usually voids your warranty. Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

ftp.cs.buffalo.edu
garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117) |

KD4MOJ maintains a scanner modification server for people | without FTP access. You can request a list of scanner | modifications by sending electronic mail with the words GET | INDEX.TXT to FTPmail@exchange.tlh.fl.us

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here are least two companies which repair scanners:

1. Electronic Repair Centers (telephone 708-455-5105) - Several people have been pleased with good repair service from Electronic Repair Centers in Franklin Park, Illinois. Although they are not authorized to perform warranty work, this outfit has been repairing Bearcat scanners for several years. They charge a flat rate of fixing scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

2. G & G Communications (telephone 716-768-8151) - This family owned company repairs scanners and stocks parts for several older models. G & G sometimes buys old scanners, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is the Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores.

I also recommend the book, Monitor America, 2nd edition published by SMB Publishing, and available from Grove Enterprises for about $25. This single edition contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here are least two companies which repair scanners:

1. Electronic Repair Centers (telephone 708-455-5105) - Several people have been pleased with good repair service from Electronic Repair Centers in Franklin Park, Illinois. Although they are not authorized to perform warranty work, this outfit has been repairing Bearcat scanners for several years. They charge a flat rate of fixing scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

2. G & G Communications (telephone 716-768-8151) - This family owned company repairs scanners and stocks parts for several older models. G & G sometimes buys old scanners, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is the Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores.

I also recommend the book, Monitor America, 2nd edition published by SMB Publishing, and available from Grove Enterprises for about $25. This single edition contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several

3792. Introduction to Scanning

Newsgroup: rec.radio.scanner

Source record: 274346

cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's 168 page Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 6th edition is available from Grove Enterprises for about $19. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200) and Kneitel's sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

Grove enterprises sells FCC license information on floppy disks. Disks for each state are sold separately, and the information is basically the same as the FCC "state sort," i.e., transmitter location (state/city), callsign, licensee name, and type of license.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio users to identify their operations with their assigned call letters, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

The world's largest scanner club is the Radio Communications Monitoring Association (RCMA). Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are $24.00 per year, which includes the monthly RCMA Journal, which consists of approximately 95 pages. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz.

Inquiries about RCMA membership should be sent to RCMA General Manager, P.O. Box 542, Silverado, CA 92676, USA.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

AOSC questions can also be sent electronically to:

rccons!aosc_hq@telerama.pgh.pa.us or
dave.marshall@f240.n108.z1.fidonet.org.
FidoNet: 1:108/240.0

AOSC also has a MEMBERS & EDITORS Scanner related echo, AOSCNet, distributed via FTN on 6 BBS systems, and via Internet Mailing list. Rick Christian advises these strict

rules for the AOSCNet Scanner Radio Echo (as of 2/1/94):

1. No discussion of cellular modifications or discussions on how to monitor cellular transmission.
2. No discussions on topics which would violate the ECPA '84, TDDRA '93, (18 USCA 2510 et seq.) or Communications Act 1934 & 1984 as amended (47 USCA 705), i.e., decoding/reception of paging, cellular, encrypted stuff, descrambling etc..
3. No Aliases.
4. No discussion of Shortwave or Amateur Radio material (except SAREX).

For info on the ECHO only, contact:

R.E. Christian, AOSC PA/AOSCNet Founder
PO BOX 12763,
Pittsburgh PA 15241-0763.
FAX: 412-831-5860.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of

information and frequency lists are often distributed in the form of free handouts. Members sometimes sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. A one year subscription is available by mailing a $10 check, payable to Kim Moran, to:

The Command Post
attn. Kim & Ted Moran
6143 W. Touhy Avenue
Chicago, IL 60646

Many CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. If you have a modem and

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of

information and frequency lists are often distributed in the form of free handouts. Members sometimes sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. A one year subscription is available by mailing a $10 check, payable to Kim Moran, to:

The Command Post
attn. Kim & Ted Moran
6143 W. Touhy Avenue
Chicago, IL 60646

Many CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. If you have a modem and

I recently called Marymac to inquire about a battery case for my Pro 43.
They referred me to an 800 number that may be the one you are looking for:
1-800-442-2425 I hope this helps you out.

Get this USE the "LAW" to OUR advantage, they didn't outlaw the replacement
parts did they. How can you outlaw resistors, capacitors etc... And like
was said before you probably can order a "REPLACEMENT" microprocessor, ROM,
memory etc... from canada via Radio Shack there (PRO-2006, etc...).

The 62-1040 is the right number, and they can order it straight from the
warehouse. Also, I don't know if anybody has posted this or not. If
they have, sorry for the double post. The frequencys on indy drivers
are listed in the back of the book. They also have several for NASCAR
and other types of racing. They also have an address on listing to
races on scanners.
They also have frequencys on disney land in ca. and in fla.

Mod is modification. It is a change made internally to the radio/scanner that
allows it to have additional "features" it didn't have before. Usually a mod
is soldering/desoldering/ a connection.

I have a number for Radio Shack National Parts as (800) 442-2425, but it could be left over from the bad old days when I managed Radio Shack stores (the computer center in Santa Barbara and regular stores in Carpinteria and Lompoc).

Another number, for mail order parts, is (800) 223-8344. I've used that recently for a personal order so that I could avoid dealing with non-responsive store personnel.

By the way, about 11 years ago (when I was managing the Carpinteria Radio Shack store) I started a local scanner frequency list. Since I see from your address that you are at UCSB, I wonder if you've used it (the current version, which is on Santa Barbara City College's BBS, is dated October 1993). I will be uploading a revised version in a couple of weeks with several additions now that someone brought to my attention the FCC database for California on the Internet. It has 840 local frequencies listed.

3806. Sheriff's Office Closing Codes

Newsgroup: rec.radio.scanner
Date: 1994-05-16 05:59:04 UTC
From: brianr1@aol.com
Message-ID: <2r7238$ifb@search01.news.aol.com>
Source record: 274359

My local sheriff's Office uses closing codes that consist of usually four letters. The deputy will give this code to the dispatcher before going back into service at the end of a detail.

Any ideas as to what the codes mean and how they are used? Is there any way to get a listing of them and there use?

Thanks,

BrianR1@AOL.COM

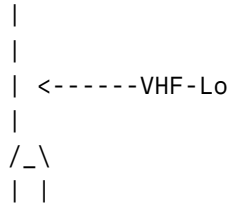
3807. Water problems with Discone antenna

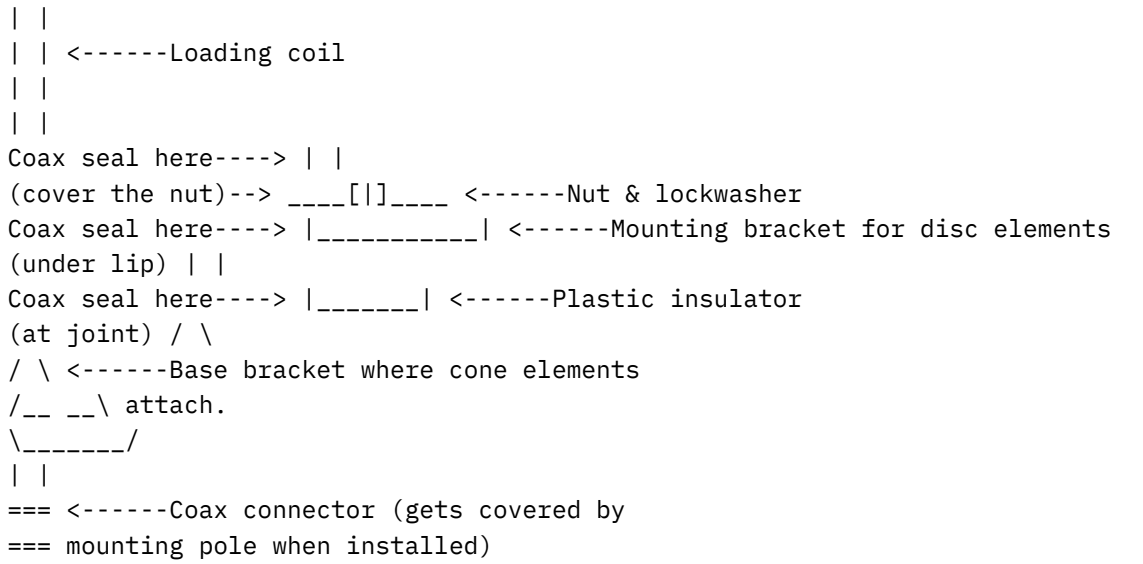
Newsgroup: rec.radio.scanner
Date: 1994-05-16 06:07:10 UTC
From: gkd@wpi.WPI.EDU
Message-ID: <2r72ie$8lc@bigboote.WPI.EDU>
Source record: 274364
Cross-posted to: rec.radio.scanner,rec.radio.amateur.antenna

I recently found that water had seeped into the base assembly of my Sigma SE-1300 Discone antenna after less than two months of service; causing a dramatic decrease in performance. Owners of Diamond D-130J and ICOM AH-7000 discone antennas may want to take note as well. Since these antennas are very similar in construction (and price) to the Sigma, they could conceiveably exhibit the same susceptibility to water problems. [Note: The Sigma SE-1300 is made in the UK, and is sold in the U.S. by Tucker Electronics, Radioware, and others.]

In retrospect, I believe my antenna's problem began within days of its installation. After two months, reception in the 450 and 800 MHz ranges had become so poor that a cheap, homemade VHF halfwave which I build out of scrap aluminum tubing was working better than the discone. The discone had been meticulously assembled and installed, and had no visible defects, so I didn't see how it could be performing so poorly. But an ohmmeter check showed a fluctuating DC resistance of about 10K ohms between the center conductor and shield of the antenna connector, which should have been completely isolated from each other. That immediately suggested water problems.

Fortunately, I found that the antenna's base assembly comes apart very easily. Disassembling it revealed quite a bit of water and corrosion inside. The coax connector itself was dry. It appeared the water came down through the hole for the mounting screw which the top VHF-Lo band vertical element attches to. This screw is actually a long rod, the bottom of which is the center conductor for the female "N" connector at the base of the antenna. The shaft of the rod inside the assembly was discolored, but once I cleaned and dried out the inside of the assembly, everything else looked fine. After putting it all back together, the improvement was incredible; especially in the 450 and 800 MHz ranges. In order to (hopefully) prevent the problem from recurring, I used coax seal to cover from the base of the vetical VHF-Lo element to the top of the bracket which holds the disc elements. I also sealed the junction between the disc bracket and the plastic base insulator underneath it, and between the plastic insulator and the metal base bracket which the coax and cone elements attach to.





To disassemble the base bracket on the SE-1300, first unscrew the VHF-Lo band loading coil from the base assembly, then remove the nut and lockwasher beneath it. The disc element mounting bracket should just slide off at this point. Next, unscrew the plastic insulator from the metal base bracket where the cone elements attach. You'll probably need to use pliers. Once the insulator is removed, the inner metal threaded rod will slide right out, and you're done.

I would suggest owners of these discone antennas check the DC resistance periodically between the center conductor and shield of the coax. Anything but an infinite reading on the ohmmeter (open circuit) is an indication of problems. As I said, mine registered around 10K ohms; and this was after four dry, sunny days. Another test would be to monitor the SWR of the antenna at higher frequencies (like 450 MHz) if you have the capability of doing that.

Since my problem began before I'd even become accustomed to the antenna's proper performance, it wasn't until the thing was near-deaf that I finally decided there had to be something wrong. There were some heavy rain and ice storms a few days after I installed the antenna, which is probably when the problems began. I'm surprised at the antenna's susceptibility, but because of its simplicity and the fact that nothing appeared to be cracked, loose or damaged, I'd be inclined to believe it is a design deficiency rather than a defect.

Greg

hey now! i'm planning a trip to Oahu & Maui and i was wondering if any of you had any cool freqs for these areas...

about six months ago, i went to Oahu only and i copied the following freqs:

Hilton Hawaiian Village
Honolulu, Hawaii
461.65 Banquets
462.175 Housekeeping
462.8 Pager
463.8 Security
464.425 Registration
464.825 Maintenance
464.875 Security

Ala Moana Shopping Center = 463.8
Bishop Museaum = 461.2875
Royal Hawaiian Shopping Center = 461.85
University of Hawaii, Manoa = 464.1
Windward City Mall = 461.125

453.7 R Medical EMT phone patches w/ Doctors, "MedCom"

138.6 Dial Tone & Busy Signal in Kaneohe area (Phone Patch)
138.975 Fort Weaver Rd & Renton Road (Pearl Harbor?),
10_Alpha, Control, Guard Mount, Zero this is One One
139.025 R Control, Whiskey_1, Whiskey_3, Patrol_26, Schofield Barracks,
"Negative Whiskey Whiskey" = no wants & warrants,

Enroute SBUCC, A Quad, "Tango" = I copy,
Code Six = radio stand-by, Wheeler AFB
139.55 Delta, Delta_4
140.55 Daneohe MCAS?
142.625 unknown traffic
144.0 R Engine 4, Engine 7, Engine 9, Engine 11, Engine 12,
Engine 15, Pumper 8, Rescue 22, Crash 1, Crash 2
164.2 Commanders Call at Paradise, Building 1202, Officer's Club,
Hicham Elementary School, Hickam Police, Legal Office,
Police_2, Police_4, "Transmit Police_2 X-I"
(base station heard -- no mobile units heard)
164.25 Brewster_1_Brewster, Brewster_Charles_Brewster, Return to Papa
164.325 R Nimitz Gate, Transporting an "X-Ray" (a female), Pearl
Do you have Channel Seven?
164.65 Two transmit sites = Tripler Naval Hospital & Tantalis
165.2375 DVP, Which Delta team is one the waterfront? Delta_35
165.2875 simplex traffic too distant to copy

166.675 DVP
170.025 R Barbers Point, Alpha Clear
170.505 trunking tone heard
171.05 R Barbers_206, On the flightline they should be on Tac 4,
Flightline Security Watch, Hanger Watch
171.975 R Loose onloads for 747 not a DC-8, Waiting on potable water

on 91712
407.375 Control, Leaving Hickam now, O.M. One
413.325 R Dispatch, Taxi_1, Taxi_4, I've already informed Command Post,
Refueling aircraft, "Lima Lima" = landline phone call
"Charlie Foxtrot" = caucasian female,
"Charlie Mike" = caucasian male,
"November Foxtrot" = negro female,
"November Mike" = negro male,
Hornet & Saratoga (Pearl Harbor?)
414.65 R APHIS (Animal/Plant Health Inspection)-Honolulu Airport
415.05 DVP
415.8 Unit 4
418.9 R Center 10-7 for the evening
419.175 simplex traffic

that's all i had time to copy ...

take care!

>-Pete-

Here is Bob's posting on the subject.

UNIDEN/BEARCAT 200/205XLT
TEST MODE

by Bob Parnass, AJ9S

For the Uniden 200/205XLT, the following procedure will load
channels 1-25 with various test frequencies, and zero the
remaining 175 channels:

1. Press and hold three keys: 2, 9, and MAN simultane-
ously and turn the power switch on. This clears all
memories.

2. Set the power switch to the off position.

3. Repress and again hold three keys: 2, 9, and SCAN
simultaneously and turn the power switch on. This
loads some memories with test frequencies.

Some of the frequencies will be out of range, like 108.5 and
66.45 MHz, but will not permit reception.

This procedure works with several Uniden, Cobra, and newer
Regency scanners.

It does sound like low batteries. When the volume is up high, the unit
requires more current to drive the audio amplifier. If the batteries are not
capable of supplying the needed current, the audio amp will be non-linear and
it will distort the sound.

>asplund@aludra.usc.edu.

I couldn't find anything on the 726R, but I had this on the 727R. I have no idea if this info would apply to your radio or not. You decide.

YAESU FT-727R

Modification for extended coverage. (This will work for both the old and new CPU versions)

-Remove the battery pack

-locate the RAM backup switch according to your manual (this will be the switch FARTHEST away from the battery terminals)

-Turn the switch off, count to 4, then turn it back on

-Relace the battery pack

-Turn the rig on. The readout should be entirely blank. If it is not, you probably did not wait long enough before turning the switch back ON, so repeat the above procedure.

-Type in the following: ' 001111 '

-The rig should now come to life. You will have to reprogram all the memories as well as the repeater splits for both bands. The display will now cover 100-199, 400-499MHz, but it obviously won't work over this range. Mine covers 139-153, 420-460.

- The reset code is in your manual

[From another source:
The factory code to make
the program from the factory is (443300) and if you enter those digits the talkie will return to normal again. However if you enter the code (601111) you will notice the talkie will come up in a different mode you can and must input 5 digits instead of 4 to input a freq.

Example in the normal mode to get freq 147.06 you would enter 7060 then hit the dial button.

In the expanded mode you would enter 47060 to get the 147.06 cause your display now takes and controls the last 5 digits of a freq instead of the normal 4.

I would not agree with this statement. The Fire service transmissions at 70.5 to 71.5, using AM, may be repeated in the 452 Mhz area on FM if a mobile repeater (extender) is in use at an incident.
If you need further specific info please contact me.

>allows it to have additional "features" it didn't have before. Usually a mod
>is soldering/desoldering/ a connection.
>Charles

To understand the concept a little better, it helps if you know why such mods
are possible.

In order for manufacturers (and designers) to save money, they produce a
single radio (or at least the same internals) with all functions and features.
This way they have a single manufacturing line, rather than many. Then they
disable features depending on which county it will ship to or which model they
plan to sell it as. So low end radios can often be easily changed to enable
the high-end features. Modifying radios has become so popular that it has
evolved into a true hackers paradise. Some of the more involved mods involve
replacing components such as memory chips to expand the number of memory
channels. The most commonly sought-after mod is to restore the frequency
range where cellular phones are found. When the law was passed in the U.S. to
exclude this range from scanners, to save the high cost of reprogramming the
microprocessor, they use "select" lines on the micro to enable or disagle this
frequency range (and other features). This way they can use the same micro in
all units regardless of which country the scanner will be shipped to. To
restore cellular on many scanners, you just open a jumper on the micro's
select lines.

If the two prongs have spread too wide to make good contact, just bend them back! If you really want to replace the BNC connector, make sure you buy one that has a tube-type recepticle in the center rather than the 2 prongs (I think AMP and other make them like this). Replacing a BNC is not an easy task for most radios.

>Radio Shack has a cordless phone that scrambles the conversation between
>the base and handset...I've tried it and it works...you simply cannot
>understand the conversation on a scanner. It runs about $150.00.

From the R/S 1994 catalog, it is #43-565 on page 65. You can't
understand the conversations unless you have a speech frequency
inverter! The Ramsey SS7 inverter works, after I modified it.
Do any of you know if the new SS70 is any better than the SS7?

R/S has a new 900 MHz phone too. It sells for $300 and looks a
little like the Tropez phone but it does not claim any kind of
scrambling or digital technology. The Tropez is over a $100
cheaper and scrambles too!

David

In a recent post malcolm (malcolm@bga.com) asked what was meant by mod files in the context of this newsgroup.

Many scanners can be improved or modified for better performance/frequency coverage by performing a simple circuit alteration. In this context, MODS refer to the restoration of coverage of the 800MNz cellular mobile telephone frequencies. However, after April 24th 1994, new models of scanners imported into the U.S. will be very difficult if not impossible to modify or restore to cover cellular. Hope this helps!

What freq.s are you interested in? The stock antena isn't much good for DX and
if money is an issue, and space obviously, that rules out a lot of options. If
you are interested in UHF and higher you can get the RS 20-006 whip and the RS 278-116
right
angle adapter, both for under $15.00.

Hello all,

I recently bought an IC-R100 and have NOT been very happy with it. In fact it is one of the poorest scanners I have seen from an "operational" stance. It has 100 channels and 10 search pairs. It comes with a mobile mounting bracket and power cord. (optional accesories include DC converter and cigerett adapter). To use the R-100 in a mobile is a frustration indeed! The stock speaker can't be heard above average road noise. The search functions are so limmited that you start to resist the urge to toss the thing out the window. The programmed searches can't be resumed by turning the BFO or the up and down keys. This is a MAJOR defect in the design of this system. The 100 channels can't be separated into blocks so you have to constantly program the skip fuctions to listen to ranges. The ONLY saving grace this radio has is it's audio. It has the BEST audio quality of ANY scanner I've heard so far. I used an OPTIMUS Pro7 speaker to test all my scanners and this one sounded the best.

Am I alone in my distaste for this scanner?

Actually, the 20-161 antenna and the 278-117 would give him better reception,
particularly on the lower frequencies.

155.370 DPS Austin (Trunked system so you'll only hear the dispatcher)

The DPS DOES NOT now use a trunked system. It uses very large towers, lots
of them and simplex. The CORRECT DPS frequencies are:

155.370 Intercity Base (every PD in TX has this freq)
154.950 Intercity Mobile (everyone who has anything to do with
law enforcement has this; including
customs, game management. The "channel
19" of TX Police band radio. The lets
go to lunch frequency; lots of chit-
chat; used in multidepartment support)

154.680 Mob to Base - simplex; you need to be close to the DPS vehicle
155.460 Base to Mob - simplex; easy to hear
154.695 Simi-duplex - not use much
155.505 Intel/Narc-Statewide (busy; usually scrambled)
157.350 Dallas North Tollway - not relevent to Austin
159.090 Mobile relay - not used much

I have the entire state of TX on CDROM and several good freqs for the
Austin Metro area. EMAIL me for more info. (one at a time please...).

>Yeh,
>Thats why I said UHF and higher...

I doubt if the 20-006 would do any better at UHF than the stock antenna. I have both and don't notice any real difference at those short wavelengths. The main trouble I have is the 150 MHz and below. But, if he wants better UHF too, an outside antenna with low loss coax is the answer. If he's in an apartment like me, that may not work. :-(I mounted my discone on the top of my ceiling in my second story apartment and it works much better than the whip that comes with the Pro-2006. I have it in the corner above my shack desk so I don't poke myself running into it. :-)

I thought I had the same problem until I compared my Pro-2006 and Pro-43 using *exactly* the same antenna. My Pro-43 on a rubber ducky was picking up a NOAA station 50+ miles away in CT, but my new Pro-2006 on an outside antenna wasn't hearing a thing from that station. I thought it was the radio until I connected the Pro-43 to the outside antenna and didn't hear the CT station there either. Then I reattached the ducky to the Pro-43 and walked around the room. In certain places in the room the NOAA station could be heard. In other places in the room it was dead.

VHF signals are very finicky and moving an antenna an arm's length one way or another can make ALL the difference in the world, so it's very important to use the same antenna on both radios. IOW, a test using a rubber ducky on the hand held and a base antenna on the 2006 doesn't tell you anything except that one _combination_ works better than another at that particular instant in that particular location.

In addition to using the same antenna you need to compare them on the same station. NOAA weather radio stations make good test subjects because they are always on the air and they stay stationary thus giving you a constant reference point.

>I'm going to return it, if I don't get better
>signals.

You could have a bad 2006. If so, return it for another 2006.

Don't take this the wrong way, but are you sure? The R1 allows this and I
thought the software in both radios was nearly identical.

> of this system. The 100 channels can't be separated into blocks so you have to

You probably have just one block that you can set the bounds on right?
The 10 search pairs allow you to denote bands, but I guess not frequencies.

Basically you've run into the problem that you bought a radio receiver,
and not a true scanner. That's why it doesn't have all the functions
you expect in a user-friendly scanner. The R1 is the same way, although
the R100 has a much better radio than the R1.

What handheld? I own a 2006 and its better than the PRO-39 or PRO-43.
(assuming all have stock antennaes).

Do you have the switch on the back of the 2006 switch to 10db atten?
That definitely will reduce what you can pickup.

Definitely get a good antennae. A discone or even just a the long coil
loaded whip will do better than the little stock antennae.

With a discone mounted in my 2nd floor apartment, I've picked up signals up
to 40 miles away with my 2006 (not counting airplanes).

(Your distant reception will vary with your antennae height).

> The fact that someone may have put in a great deal of research
> or time to assemble a database of factual information ("sweat-of-
> the-brow" effort) does not automatically provide a basis for
> copyright
> protection unless the presentation of that data (the arrangement)
> can be shown to reflect some degree of creativity. As per
> the above, simple alphabetical and/or numerical data sorts
> have already been viewed by the court as not be protected on
> the creativity/copyright basis.

There is also the application of the "Fair Use" doctrine to consider.
Using any reference work as the basis for further research (including making
copies of pertinent portions of the work for students, etc) is generally held
to be Fair Use. Xeroxing somebody's published scanner listings into your own
book for republication is not Fair Use.

However, I found from actual experience that copyright violations are
difficult to prosecute. The Feds are only interested if you can prove a loss
of >$10,000 due to the infringement. It's tough to get a judgment in Small
Claims Court if you can't get prosecution.

Thank you VERY much for posting this. I have an assembled Diamond D-130J discone sitting in my living room awaiting the new mast. The timing of your bulletin could not have been better. I already coax-sealed the cable connection to the feedpoint, but now I will be sure to seal the other points that you mentioned before it goes on the roof. Thanks again!

3836. Regency R4030 - What is this!?

Newsgroup: rec.radio.scanner
Date: 1994-05-17 00:21:45 UTC
From: eric@garnet.msen.com
Message-ID: <2r92mp$dj9$1@garnet.msen.com>
Source record: 274290

I have a Regency R4030, that I find works quite well. It's been mod'ed to restore the 800's. My question is... is this model the same exact unit as a bearcat or a uniden? I've heard that it is, and I'm not sure. Also, what neat features (hidden, that is) does anybody know about for these units? Does anybody else also find that the battery lasts for about 20 minutes and then is dead, even after a full recharge?
All replies are appreciated. Acutally, please reply via e-mail, if possible, too (eric@golan.org). Thanks.

> this and I thought the software in both radios was nearly identical.,,,

I have both scanners. I have noticed the same search limitation
in the R-100 as Mr. Glidwell. With the R-1, one is able to resume a
search from where one is by dialing the tuning knob. Not so with the
R-100. If one breaks the search (not the squelch) with the R-100 by
touching the tuning knob or up/down arrow, the search is over. One has
to start searching from the beginning of the range.

So, the only choices for searching: stop searching when a signal
is found, stay on signal 5 seconds and resume search even if the signal
continues, or stop on signal resuming search 2 seconds after signal stops.
These are called, respectively (honest!) infinity, pause and off.

If you want to resume searching earlier than the scanner does, or
if you want to pause longer than the scanner does, you're screwed.

Source record: 274301

pardon if this is a second post, I posted to alt and thought it would
cross post but haven't seen it.

I bought a graphic equalizer at the swap meet for $25 and it is
GREAT for filtering alsorts of nasty things that come out of my r.s.2006
scanner! I take the tape out into the graphic equalizer left channel
input. I listen through headphones on the front of the g.e. and filter out
tones / whistles etc. I took the left channel out and put it into the
right channel input to see if _more is better_ and found that it isn't
needed. So, I hooked my Sony 2010 into the right channel and can filter sw
in the right ear. Haven't tried to listen to both at the same time but ...
All of the above took a few rca to phono and back adapters but
it's well worth it.

take care

> - - Eric

The 4030 is the same as the BC200XLT. Only the case is different. The battery problem you are experiencing is either due to the fact that you have a shorted cell in the pack, or the voltage cutoff is too high for the scanner (there is a mod to fix this problem).

If the tones you heard were distorted sounding, it was probably intermod. If the tones sounded clear, then you may be hearing pagers, or some notification tones for different agancies. Pagers and intermod are essentially the same thing to most scanner listeners. There is not a lot that can be done when you are using an HT. You may want to see if you can hear them on the 2m side of the radio as well as the wide-band side. Choose which ever is better.

I agree that the software of the R1 sounds slightly better than that
of the R100, but the receiver portion has significant problems. Intermod
is so bad that "scanning" is a euphemism. The radio will lock on to a
frequency from way off of the center of the freq. If you have several
different freqs that are close together, and you're scanning them, you're
likely to lock on one when you really want to lock on the next one. The
primary advantage of the R1 is that it has a BFO, and it's compact. Audio
is poor, and the builtin battery doesn't last long at all. Still, I probably
wouldn't get rid of mine.

Robert Allen, rja@sun.com

DISCLAIMER: The views expressed in this posting are mine, and
do not necessarily reflect the views of my employer.

In 1993, approximately 80 people were killed with so called Assault Weapons.
In that same year approximately 300 people were killed by bee stings.
These statistics cover the United States and the 80 number is an annualized
figure derived from the Justice Department and quoted by Dianne Feinstein.

Recently I saw an advertisement on Pop Com. on an anthena for 800mhz (supposed to improve cellular reception). Has anyone tried that?

Also, is there any decoder for Pager transmissions?

I would like the opportunity to thank this group for supporting begginers, unlike many other groups. I ordered my PRO-43, and will be using it in a few days.

In a recent post malcolm (malcolm@bga.com) asked what was meant by mod files
in the context of this newsgroup.

Many scanners can be improved or modified for better performance/frequency
coverage by performing a simple circuit alteration. In this context, MODS
refer to the restoration of coverage of the 800MNz cellular mobile telephone
frequencies. However, after April 24th 1994, new models of scanners
imported into the U.S. will be very difficult if not impossible to modify
or restore to cover cellular. Hope this helps!
73 de VE2XZ/W1
mc@shore.net

Just a slight addition to your explanation - mods is short for
modification. Many radios are sold with certain frequency receiving
capabilities, and by performing a mod, the frequency range can be increased.

Some mods will also permit a radio to perform other functions, too, like
increased scan rates, the backlighting staying on indefinately, etc.

Hope this helps, too.

Scott

I think what you're hearing is the control channel of a trunked system.
Sometimes the control channel will move from "channel1" etc. to the other
channnels allocated to the system. (typicaly at 00:00).

What I do is lock out the control channel on a daily basis.

RT�probably be spending most of my time in Cambridge (having only been
�i the area once for a short vacation I have no idea what this means
�geographically :) and I am mostly interested in police/fire/private
�security type stuff.

Here's a few:

470.3125 Cambridge Police
471.3125 Secondary " "
154.355 Cambridge Fire (simulcast from 800mhz)
471.0625 Harvard U police
472.5375 MIT Police
470.6625 MBTA Police (all over)
460.350 ch1 Boston Police Spec ops
460.450 ch2 Boston area A
460.225 ch3 Boston area B
460.400 ch4 Boston area E
460.500 ch5 Boston area D
460.175 ch6 Boston area C
460.300 ch7 Boston car/car
460.125 ch8 Warrant/license checks
460.075 ch9 Detectives
483.1625 Boston Fire
.1875 fireground 1
.2125 fireground 2

That should get you started. For the services in Boston, there are
many more freqs than the ones listed. Good advice is to stop by U do
it Electronics and pick up a copy of Scanner Master for Ma. It is the
ultimate authority on freqs here.

3872. Peak Conservation Receivers via Utility Companies.

Newsgroup: rec.radio.scanner
Date: 1994-05-17 22:49:19 UTC
From: af546@yfn.ysu.edu
Message-ID: <2rbhlf$e3p@news.ysu.edu>
Source record: 274321

Does anyboby know the frequencies used by utility companies for their
Peak Conservation Receiver Boxes they install on customers central rair
conditioners as an option to cutt off customers A/C during peak periods
of high consumption.
Here in Cincinnati, the Cincinnati Gas & Electric Company offers between
$4.00 to $24.00 rebate credit for those costomers that agree to be "cutt
off" from periods between 10 minutes to 25 minutes out of each half hour
period of peak emergency demand (determined by the utility co.). Each
customer has to have the utility company install a radio receiver with a
cut off switch beteen the central air unit and the breaker box next to the
compresser.
Anyone have any ideas?

An ARRL employee (and others) have argued that ECPA and TDDRA have no effect on hams, and therefore ARRL was justified in basically ignoring the threat to other radio hobbies. Here are some more facts:

* Forwarded from "SCANRADIO"
* Originally by Glenn Cummins
* Originally to All
* Originally dated 15 May 1994, 13:31

As has been rumored and suspected, Kenwood has removed the 800-900 MHz reception capabilities from their TH-78A dual-band Ham HT. Models with serial numbers beginning with 51xxxxxxx are no longer capable of modification to receive ANY 800 MHz frequencies. The 380-420 military band is still restorable, along with the VHF and UHF expansion. Sources say all attempts at restoring even partial 800 MHz reception have failed; Kenwood says the freqs have been removed from the MPU chips used in production since early April 1994. The 200 ch memory module and other modification details remain the same as previous production runs.

>Excuse all the spelling mistakes, computer goes apeshit, if I try
>to correct them!

To answer your first question a receiver has no range per se. It depends on the relative strength of the signal it receives. So it depends on the transmitting source to "get the range"

Sensitivity and a good antenna have a lot to do with what you hear. The old saying that a bad radio with a good antenna will hear more than a good radio with a bad antenna, is quite often true. I use a RS mobil scannet antenna on my Bronco and am satisfied with it's performance. As for a base antenna I have a discone, but any good base antenna will do wonders for the 2006

Source record: 274182

I was at a seminar yesterday where a guy was using a wireless. I checked out the receiver when the class took a break but the frequency was "A4" on the back of the unit :-(I had my Yupi MVT7100 with me so I scanned the normal 160-220 band in 5K steps but didn't find anything. Then, I scanned the 470-495 band with no success. I was using the attenuator and a cheap rubber duck to eliminate all but the strongest signals. I've used this method several times at church where we have about 40 wireless mikes and have always had good results. Next, since I had all day, I scanned everything from 100 KHz to 1000 MHz with no luck. I went back and scanned 160-220 in WFM mode and still found nothing. I am baffled. I know that these seminars charge big bucks for the tapes but I am wondering if they somehow are scrambling or using digital in their wireless mike. Unfortunately, I did not have my frequency counter with me.

Any ideas?

David

3887. PRO-2028 FREQUENCY EXTENSION?

Newsgroup: rec.radio.scanner
Date: 1994-05-18 14:39:00 UTC

Can the PRO-2028 scanner be modified to receive frequencies above it's stated limit of 512MHz? I'm interested even if it's not an easy mod.
Thanks,
Al Venooker
Cornell University

You proably heard intermod from a pager transmitter. The Colorado Highway Patrol does not use a trunked system (at least for the Colorado Springs yet). For being a relatively small city, Colorado Springs seems to have a zillion pager transmitters and my Pro-43 wants to lock in to all of them :(

>Is it just a normal part of Yupi-life?

Probably it is a normal fact. I have the same. I could even feel heat through
vinyl case. It's not much heat though. According to product review by
Howard Bornstein heating is a fact, but not a big problem.
I just measured the voltage of this power supply, using digital multimeter.
It shows 18.95 V !
Now my question: is it ok? (PSU wasn't loaded).

According to one source I found in my mess, wireless microphones
uses also: 36.7, 37.1, 37.16, 40.68, 42.89, 44.87, 47.27 MHZ.
Try them. Another possibility is that microphone starts transmitting only
when voice is detected. It's pure my idea - I don't know for real.
But in that case scanner could miss frequency if the guy doesn't speak.

3891. Wanted: Boston, MA frequencies & other info(?)

Newsgroup: rec.radio.scanner
Date: 1994-05-18 17:16:50 UTC
From: cq@kidd.vet.purdue.edu
Message-ID: <CQ.94May18121650@kidd.vet.purdue.edu>
Source record: 274186

Hello... I will soon be heading out to Boston and of course I'll be bringing my scanner with me. So, I'm wondering if there are any Bostonians out there who can point me at the right frequencies. I'll probably be spending most of my time in Cambridge (having only been i the area once for a short vacation I have no idea what this means geographically :) and I am mostly interested in police/fire/private security type stuff.

Also, it looks like this may well be a permanent move for me, so I am also looking for pointers to any local radio-related resources... scanner and ham radio clubs, local radio-related publications, etc. Any and all information would be much appreciated.

Thanks,
--Rob

p.s. I looked on ftp.catt.ncsu.edu, but the file of Massachusetts frequencies seems to be truncated after the C's. While this means it probably does include what I want ("BOSTON, CITY OF" et. al.), I know from experience that interesting stuff is not always licensed by the most obvious name so I thought I should ask anyway...

On Saturday May 21'st we will have a special guest on Spectrum. Cliff Stoll K7TA the author of 'The Cuckoos Egg'. We will talk about the internet and his extremely interesting views on the communications world as we enter the 21'st century. We will in addition get a guided tour through the internet from one of the worlds leading experts. We'll also take a look at computer security. So join us for a digital Spectrum from the high-tech edge.

On May 28'th we will interview Larry Ledlow NA5E. Larry has just returned from an assignment with the UN in Croatia and Bosnia. He will clue us in on the communications scene in that troubled part of the world.

On Saturday June 4'th we will take a look at Digital Audio Broadcasting or DAB. This high-tech system of broadcasting is in the wings and should be here near the end of the century. A few systems have been proposed for dab and a standard hasn't been decided as of yet. Our guest will be Ted Schober. Ted has been on the leading edge in the world of DAB and will give us a look into the radio of the future.
--
Spectrum airs live Sunday at 0200 UTC (2200 EDT Saturday) on:

WWCR, 5810 KHz, Nashville, TN (World Wide)
WIFI, 1460 AM, Florance, NJ (Philadelphia Area)
KHNC, 1360 AM, Johnstown, CO (Denver Area)
Omega Radio Network, Galaxy III, X17, 5.8 MHz WIDE audio. (Satellite)

A while back, someone posted the formula for calculating the length of an antenna needed for a specific frequency. The formula was that the length of the antenna should be equal in feet to the frequency divided by 430. Well, maybe my math isn't as good as it should be, but I'm not getting any helpful answers out of that equation. If anyone has any other formulas to calculate the length of an antenna for a specific frequency, please post them here. Thanks!

As in my original post, I scanned from 100 KHz up to 1 GHz so I covered these
freqs. I have a special bank set up for itinerate freqs that I scanned too.
Your idea about a voice activated mike seems plausable though;
however, I scanned almost all day and this guy hardly ever shut up! :-)
I did not scan in the AM mode though. It could be that his mike was AM
but you'd think the scanner would still lock on the signal. All the wireless
mikes I work with are FM.

If you know this already then please skip the following ... but I thought
it important to reierate,

The Japanese wall transformer included with many domestic Japanese sets is
designed for 100 VAC. Use on US house current will result in an output
voltage that is 20% too high. That is partly responsible for some Yupi's
heating up.

Most such power supplies are rated (e.g. 12VDC @300 mA) at full load,
since they are unregulated. So a reading of 18.95V with no load, is
uninterpretable.

Actually, only the USA has not yet adopted the system accepted worldwide as
the standard for DAB. (Mostly because of intense lobbying by commercial AM
and FM broadcasters who see it as new competition in an already competitive
market.)
Trials of DAB has already begun in the highly populated Windsor - Quebec City
corridor in Canada, and elsewhere around the world.

3912. Yupiteru Question

I have a Rat Shack PRO-46 and a Yupi MVT-7100 (among others). My question concerns the frequencies displayed in the 800-900 mhz. area. I receive identical transmissions on both units but at different frequecies. Any ideas?

Source record: 274215

I assume that the Yupi in question is an MVT7100, if not, disregard my comments! ...

The instructions say that it must be turned off when the adaptor is plugged in to charge the batteries, it is not clear clear whether turning it on with the adaptor in cuts out the battery charger or just reduces the charge to a trickle. Clearly it will run from the adaptor with the NiCads in place but the man I bought mine from (Haydon Communications in North London) commented that this usage tends to bring thermal cutouts into action (not clear whether this is in the radio or the adaptor).

On the other hand ... mine arrived from the factory with the adaptor's power plug end (glued in place) set for the wrong polarity. The radio got VERY warm dropping the entire output of the adaptor and nicely kept the whole lot away from the NiCads. I can assure you that it can survive getting uncomfortably hot around the power connector!

One, or both, is receiving IF-related images of real transmissions. The
dual conversion PRO-46 is notorious for this phenomenon in the 800 MHz
band. That is why the scanner ban is a joke with regard to dual-conversion
rigs.

I don't know if there is a scanner that exactly meets your needs, but you may want to look at the Icom 2SRA. It is a 2m HT with a wideband scanner built in. It has built in sub-audible tone decoding (but to answer your question, you don't need this feature). It costs around $450, but it could take the place of your HT, so you would only need one radio. There are not too many scanners that cover the CB band, so if you eliminate that requirement, you will have more options. Also CB doesn't come in too well with a little rubber antenna on any scanner.

You may also want to check into Uniden's new SportCat scanner. It has some unique features.

Just a followup note to this magic key combination: Do not try to find
other magical key combinations by trying things like 3, manual,9; or some
other slight variations on the two above codes.

I tried this a while back for a few hours, and ended up with a scanner
that still works with no problems, but now will not reset except for about
every 5th to 20th try. Sometimes it takes sliding the battery on and off
to reset the thing...

So my advice is don't try to find new ways of reprogramming the scanner
from the keyboard. You very well might end up with one that doesn't reset
at all, or (worst case scenario) doesn't even work. BTW, I'm still
talking about the 100XLT and the 200XLT.

Just to let you know.

Sherrod

>Thanks!

The 200XLT and the Pro-43 are (were) rival models. The 200 is much older in design. It is a good unit, but the newer Pro-43 outperforms in in most respects. The 200 is made by Uniden and the 43 is made by GRE for Radio Shack. There have been 2 "replacement" models for the 200XLT. The 2500XLT was an attempt, and the 220XLT is the current Uniden offering. The 220 is said to replace the 200.

: to do to put one in?

Adding a BFO may not be useful, though I haven't checked
this particular radio. Often, synthesizers designed for
FM use only have such bad close in-noise that SSB/CW signals
sound highly distorted. You can check this by listening to
the oscillator with an SSB/CW receiver. Unless the signal
sounds clean--a single clear note, it might not be worth
going through the effort.

I'm assuming that someone that can redesign the synthesizer
and add narrow filters to a small radio wouldn't ask such
a question...

I'm working on an amateur station that covers *all* amateur frequencies
in use in the Northeastern US--including 903, 1296, 2304, 3456, 5760,
10,368, and 24,125 MHz. Its pretty functional already--I've made 200
mile contacts on all except the last band. But, I see little use for
an 800 MHz receive only unit, unless I can also transmit on the same
frequency. For in-field equipment repair, I prefer the 3 transverter
method--one of them ought to work and you can figure out the broken
one by the process of elimination. (transverters are receive and
transmit converters)

Thus, what exactly is the impact on amateurs?

: I think what you're hearing is the control channel of a trunked system.
: Sometimes the control channel will move from "channel1" etc. to the other
: channnels allocated to the system. (typicaly at 00:00).

I think you're right about the control channel, but I'm not so sure about
the trunked system explanation. Even though it seems like everybody is
using 800MHz cellphones nowadays, the old-style mobile radiotelephones are
still in use in a lot of places, and there happen to be frequencies allocated
for this service in the 152 MHz range. In some areas (like mine), though,
the radiophone services have been terminated and pagers abound on the old
frequencies.

Hope this helps.

Source record: 274221

19 May 1994.

The following "blurb" is taken off AOR's latest (first) information sheet on the new AOR AR8000 handheld receiver. As of today "sometime in June" is the anticipated delivery but we are talking AOR here so don't start holding your breath just yet. Price is also still undisclosed.

Cheers
Jonathan Clough

Compu$erve: 100117,535
Internet: Clough@javiaton.demon.co.uk

++
The AR8000 is the result of AOR's long term ambition to produce a new breed of radio receiver which combined full computer compatibility with advanced wide-band radio receiver technology. With the introduction of the new AR8000, AOR have broken the mould of conventional radio receiver design.

At first glance the AR8000 in its static form may look no different to any modern hand-held scanning receiver, but the similarity ends there...just as soon as the receiver is switched on!! Initially you are greeted with the opening welcome message on the AR8000 multi-function liquid crystal display "WELCOME TO THE WORLD OF AR8000 RECEIVER", in a similar way to a sign on message displayed by your personal computer. This new experience immediately demonstrates to the new user and discerning radio listener that the AR8000 is no ordinary radio but THE NEW CONCEPT in radio design. The modern new cabinet design measures approx. 152mm (h) x 69mm (d) x 40mm (w) excluding projections and weighing only 350g including NiCads (but not aerial).

The AR8000 is a highly sensitive hand-held receiver boasting a very wide frequency coverage of 500KHz to 1900MHz without gaps in the range (actual acceptable frequency input from 100KHz). Step size is programmable in multiples of 50Hz for smooth tuning. The all mode reception provides AM,USB,LSB,CW,NFM and WFM. As you might expect from a radio receiver of this calibre, an independent 2.0KHz SSB filter is fitted as standard and the USB/LSB modes use true carrier re-insertion with correctly calibrated frequency read-out (not offset by 1.KHz). A custom manufactured ferrite bat aerial is neatly installed at the top of the receivers cabinet to enhance receive performance when listening in population centres to Medium Wave services or when commentary is provided at aishows and motor sport events.

The highly visibility LCD is of a new dot matrix format which enables many new facilities to be used, many of which have never been seen before especially on a hand held design. Two VFO frequencies may be displayed on the LCD simultaneously, one providing a stand by frequency available for

quick transfer (similar to commercial aviation built-in radio transceivers. When frequencies are entered, ALPHANUMERIC comments may be stored along with frequency, mode & attenuator status simplifying the job or recalling and identifying memory channels.

The LCD provides four lines of display so that additional facilities may be provided and displayed at the same time, these include a signal strength bar meter and a band-scope showing band occupancy.

The AR8000 is equipped with almost every conceivable operating feature but operation remains easy thanks to a massive new microprocessor. A total of 1000 memory channels are provided which are divided into 20 banks, each having 50 channels. AOR have chosen to allocate 50 channels per memory bank (rather than the more conventional 100) based on findings that most radio listeners prefer fewer channels per bank but more banks for simplified operation. The AR8000 will search and scan at a very respectable (and fast) maximum speed of approximately 30 increments per second. You may even enter "special" frequencies into memory banks where they may only be recalled by entering a user definable "PASSWORD"....this will stop preying eyes.

The AR8000 is truly a button pushers delight but operation need not be difficult. As well as a comprehensively illustrated operating manual and UK quick reference guide, the AR8000 has two operating modes: NEWUSER and EXPERT. As already mentioned, the multi-function LCD provides many new facilities but the receiver has a few more tricks up it's sleeve. Not only can you connect the AR8000 to an external computer for remote control, you may connect two AR8000 receivers back-to-back so that data may be copied from one to another (small interface required for remote data access). There are a variety of scan/search commands to link banks, scan by mode, programmable delay scan, priority, auto memory store, step offset and a programmable power save circuit to increase duration of operation from the NiCads.

The mechanical assembly of the AR8000 will be a sheer revelation to any radio engineer. Surface mount technology has been employed throughout the receiver which is constructed of plug in modules. This will ensure the highest levels of performance, reliability and serviceability. The AR8000 will certainly stand out in a constructional beauty contest. Keypad illumination extends to the side panel keys and may be switched in a number of ways. Illumination "permanently on" for mobile operation is possible. A specially selected heavy duty regulator has been fitted to ensure the receiver will continue to operate reliably even with the illumination permanently selected.

MAIN FEATURES
Frequency coverage 500KHz - 1900MHz
All mode reception AM, NFM, WFM, USB, LSB & CW
True carrier re-insertion and specific SSB filter with non offset readout
1000 memory channels
20 search banks
Priority Channel
Frequency Pass

Rotary Tuning Dial
Step sizes programmable between 50Hz - 999KHz in 50Hz steps
Scan & Search speed up to 30 increments per second
Signal Strength meter
Band Scope
Backlit LCD , Keypad & side panel
Battery save facility
Separate controls for volume, squelch & dial
Attenuator
Keypad Beep on/Off
Keypad Lock
Top panel 3.5mm earphone socket
Monitor switch
Password protected banks
Programmable Scan & Search including Free, Delay, Auto, Level & Mode
Select Scan List
Clone (Copy) Data facility between two AR8000
Computer Control
Tape Output
EEPROM memory backup (no battery required)
Supplied with NiCads, charger, Hand Strap, Belt Hook & screws, earphone,
seem flexible aerial, DC lead with cigar plug
Comprehensive operating manual with over 50 illustrations & quick reference

SPECIFICATIONS
Frequency Range: 500KHz - 1900MHz

Receive Mode: AM, NFM, WFM, USB, LSB & CW

Step Size: 50, 100, 200, 500Hz, 1, 2, 5, 6.25, 9, 10, 12.5, 20, 25, 30, 50,
100, 200, 250, 500KHz or any multiple of 50Hz upto 999KHz

Sensitivity: 500KHz - 2MHz
SSB by field signal strength
AM by field signal strength

2MHz - 30MHz
SSB 1.0uV
AM 3.0uV
NFM 1.5uV

30MHz - 1.3GHz
SSB 0.25uV
AM 1.0uV
NFM 0.35uV
WFM 1.0uV

1.0GHz - 1.3GHz
NFM 1.0uV

1.3GHz - 1.9GHz
NFM 3.0uV
AM/SSB S/N 10db

NFM/WFM SINAD 12dB

Selectivity SSB 2.0KHz (-6dB) 7.5KHz (-50dB)
AM/NFM 12KHz (-6dB) 25KHz (-60dB)
WFM 180KHz (-6dB) 800KHz (-50dB)

Antenna Impedance 50 Ohm
AF Output (4.8V) 120mW (8 Ohm)
Power requirements: 4.8v NiCad / 6.0V Maganese / 9 - 16V DC external
Consumption: 150mA (nominal), 100mA (stand by), 20mA (Save)

Memory Channels: 50 channels x 20 banks = 1000
Pass Channel : 50 channels x 20 banks = 1000
Scan/Search Speed: Approx 30ch/per sec

This is the same Nissei-manufactured scanner as the Camnis HSC-050. It is
NOT a Yupiteru scanner. It is the successor to the Nissei scanner sold as
the AR-1500; but uses the full-size case of the original AR1000.

Is cell phone monitoring illegal in Canada? If it is, you don't want to
scan between 870-894 MHz in 30 kHz steps. Oh yeah, you also don't want
to hear the mobiles 45 MHz lower.

If it's legal, though, scan by all means.

What is the frequency of the tagged whale in the Star Trek movie
in which the Enterprise had to transport a whale back to the
future?

What is that frequency used for in reality?

Thanks,
Ken Morrill

OK net.scanner.gurus. I've read the group for a couple weeks. I've gone to scanner stores. I even ventured into a Radio Shack. I've read magazines. AND I STILL DON'T HAVE A CLUE HOW TO DECIDE ON AN HANDHELD SCANNER. Please help me before I use the "how much can I afford method?" and wind up with something less than optimum (i.e., a piece of junk).

In general, I'm looking for a monitor radio for use in a hot air balloon. I generally use 2 meter ham for communications (Yes -- I'm a ham -- KB0US -- and, yes I have at least one ham on the crew to run the radio). I'd like to monitor other balloonists using GMRS, CB, aircraft, VHF business band, and as a partial backup to the 2 meter radio. The basic requirement is to be able to easily program frequencies. I probably don't need to program more than 10 channels at any one time. I also don't need to be able to "search" very often although it would be nice to "search" for a signal and then store it for times when someone says "I dunno what frequency we're using. I jus' press da button."

I also believe that some VHF business radios have a tone encoding scheme. I assume (although I don't know) that this is used to filter who can trip the squelch. My guess is that it's sub-audible and it doesn't affect my ability to monitor these. Can someone clarify/correct/amplify on this?

What say ye?

Thanks,

Mark

This is not true, it is possible to resume the search, you just need to
know how.

Use the MW key to resume the scan. It is the one that is `
second down from the top on theright side of the keyboard.
You have to be in the search-skip mode for this to work.

Here is what I learned while preparing for the Technician (Ham) exams:

(for half wavelength antennas)

Antenna length in feet = 468/frequency (im Mhz)

(for quarter wavelength)

lenght = 234/freq(in mhz)

Hope this helps

>frequecies. Any ideas?

You must be more specific. I'd say Yupiteru is more trustee unit.
Second you mentioned "among others". Does others receive this range?
Put 3 units on the same frequency and compare result.
If you don't have 3-rd unit in that range try to set some cellphone channel
on both units. Ideally you must hear the same on both. If one unit is bad
the bad one won't give you any voice. Unless the bad one has a frequency
mistake, which is even to 30 kHz, what would be very strange.

Here are some of the "goodies" gleaned from my scan list:

Boston Fire F1 (Operations/Dispatch) 483.1625
Boston Fire F2 (Fireground) 483.1875
Intercity Fire ("MetroFire") Bases 423.2875
Intercity Fire ("MetroFire") Firegrnd 483.3125
BAPERN (ch3) 470.7875
Boston Police (citywide emerg/tac) 460.3500
Metro Radio Assn 462.7250

NOTES: My interest leans toward fires, as may be seen above.
BAPERN= Boston Area Police Emergency Radio Network. It is used for
communications between cities.
MRS is a group of news gatherers and fire buffs who often provide the
interesting details about a fire for which the departments don't have time.
The added benefit is that they scan frequencies for over 100 communities
and broadcast only the interesting events! What a deal!

I am a proud member of the Boston Amateur Radio Club, which meets every
third Wednesday of the month at 7:30pm in the Lotus Building on First Street
in Cambridge. (Club repeater is 145.23 MHz) For other Eastern MA
clubs, call the ARRL Eastern MA hotline 1-800-310-ARRL.

I stand corrected--and quite happily so! This does work, although
only in search-skip mode ("programmed skip scan" in Icom-ese) and
not in regular search mode ("programmed scan"), as Mr. Crisp says.
It would have been much better to be able to use the tuning knob or
up/down buttons, but at least now I can make it get on with searching
when I land on junk, so this is *much* better, thank you. I still
can't find this in the manual...

You got anymore of these?

|The mechanical assembly of the AR8000 will be a sheer revelation to any
|radio engineer. Surface mount technology has been employed throughout the
|receiver which is constructed of plug in modules. This will ensure the
|highest levels of performance, reliability and serviceability.

Hmm, this is contradictory; the U.S. military doesn't like unecapsulated SMT use because vibration fatique cracks the solder joints between the SMT components and circuit traces.

|MAIN FEATURES
|Frequency coverage 500KHz - 1900MHz

From an American standpoint, the BIG "Q" is whether or not the unit is similar to the AR-1000 unit in having a keyboard reprogrammible EEPROM to determine frequency coverage, such that the special "Forbidden Frequencies" can be reprogrammed into the EEPROMs. Can they? And if not, are "spare" ICs availible to allow a competant technician to restore the Evil coverage?

I think they abandoned that approach as of the first (of three) version
of the AR1500.

Besides, this scanner isn't manufacuted by Nissei like the previous AOR
handhelds (right, Jonathan?)

The latest issue of Monitoring Times has an article on do-it-yourself antennas, they have the equation:

Length in feet= 468 / Freq you want to monitor

I am using one for cordless phone monitoring, so I divided 468 by 46Mhz to get about 10, so I cut a 10 foot cable and BOOM I recieve about twice as many clear transmissions in the 46 Mhz region.

Jonathan said it was to be priced under 449 pounds sterling. So units
imported from UK to the US should be about $675.00 (ouch).

Of course, it wouldn't be legal to import them unless a cellular-blocked
version were produced.

3948. AOR AR8000 price

Newsgroup: rec.radio.scanner
Date: 1994-05-20 00:35:10 UTC
From: spencer@ucssun1.sdsu.edu
Message-ID: <2rh0ju$2vv@pandora.sdsu.edu>
Source record: 274245

Does anyone happen to know a rough estimate on a price for a AOR AR8000 or is that something that we don't talk about privately. I was just wondering what it was going for since I read so much about it.

Thanks,
Spencer

3951. Need Upper Michigan Frequencies

Newsgroup: rec.radio.scanner
Date: 1994-05-20 02:10:07 UTC
From: msadkins@mtu.edu
Message-ID: <2rh65v$jlq@pace1.cts>
Source record: 274250

I know it's absurd and not even worth trying but I will anyway.
I need frequencies for Delta County Michigan. This includes the cities
of Gladstone, Escanaba, Rapid River, Perkins, Rock, Wells, Bark River,
and that's about it. It is extremely doubtful that there is anything
listed for anything past the first 3. Any help would be greatly
appreciated. Thanks!!!!

I have one of those boxes on my central air unit, and it's on the
local utilities' dispatch freq. It must drive the crews nuts to hear
that crap all the time....it sure drives me nutso! And they weren't
even smart enough to use CTCSS or any encoding. The frequency on my
unit is not only written on the PC board inside the unit, it also is
on the crystal inside the box.....not too much of a secret!

Yes most business and police use CTCSS. Another option depending on how wideband reception you want is the Yaesu FT-530. It is a 2M 440 transceiver that also has fairly wideband receive. I also heard it can be modified for even wider reception.

Hi Brett,

I was told that it would cost "No More than 450" (GBP) and my
guess is 449.00 retail in the UK but I could be way off. Until we are
told firmly this is all a little bit of "feeling in
ones water", and this does include 17.5% tax for sales within the
EC.

>Does anyone own a TR2400??
>
>Ken
>
The TR-2400 is manufactured by Nissei who made the AR1000/Fairmate
HP100 etc. Fairmate (Ashai) are no longer in the Japanese scanner
field. They sold the tooling which they owned but Nissei used for
manufacture back to Nissei who then started to badge radios under
two new names. Camnis & Trident.

TR-1200 & Camnis HSC-010 = same radio = AR1000/HP100
TR-1200 & Camnis HSC-050 = same radio = Nissei competition to MVT-7100 &
AR8000
TR-2500 = AR2500
TR-980 = AR1500 without SSB and 50(?) channels

When I was a member of SPEEDX in the late 70s and early 80s, I recieved a QSL from San Francisco for a VOLMET broadcast heard in the 8.8 region. However; when looking through CFL and some books on Aeradio, I did not see them listed.
I was wondering does this station still exsist?
I have noticed that New York and Honolulu seem to be heard here the most. I have noticed 8825 seems to be heavy with traffic in the evenings here in Dallas.

3968. BLUE ANGELS ??

Newsgroup: rec.radio.scanner
Date: 1994-05-20 15:38:17 UTC
From: reider@acrux.GSFC.NASA.GOV
Message-ID: <2rilh9$3gg@paperboy.gsfc.nasa.gov>
Source record: 274264

The angels will be over Annopolis this Sunday 22 and Monday 23 for comencement at the academy. Does anyone know their working freq. PLEASE mail them to me as soon as you can , I get off work at 15:30 and won't get to read any mail till tuesday and by then the show will be over..

P.S. if you know the freq used at Preakness tommorrow I would like to have them also.

Any help is appreciated !!!

3969. Mafia Frequencies wanted :-)

I plan on being in the Big Apple area soon and would really like
to monitor the mob while there. Vito and the boys seem like
really interesting scanner targets and would appreciate
some tips on which freqs etc they use.

Maybe they have a special "rubout" freq? Or perhaps
the numbers hotline? It may be that they have a cement overshoes
orderwire?

If no one can help with this, how about some of the freqs used
for bugs placed by the cops? Maybe I can hear some deals
being done in realtime along with the fellows in the radio vans?
As understaffed as the cops are always complaining they are, maybe
they could use some help monitoring the bugs etc?

Any help is appreciated :-))

In 1993, approximately 80 people were killed with so called Assault Weapons.
In that same year approximately 300 people were killed by bee stings.
These statistics cover the United States and the 80 number is an annualized
figure derived from the Justice Department and quoted by Dianne Feinstein.
According to the US Surgeon General, over 430,000 people died in the US
last year due to smoking related illnesses.

In article <B42v1rU.bozobrown@delphi.com>, bozobrown@delphi.com
writes:

Today is Wednesday, 5/18, I'm leaving Friday for DisneyWorld and
can't
find the freqs!
Here is a list I got while online......

OK, for all of you guys that can't put your radio down when you go on
vacation - The (un)official list of Walt Disney World Frequencies.
(I'll give you a hint... I work at the Magic Kingdom, so this is
about
as official as it gets.) All of these frequencies are confirmed; They
were obtained from WDW Radio/Audio Central a:nd traffic has been
heard on
each frequency.

Anything with a * indicates simplex and probably very low power. (The
radios we use at 20,000 leagues are only 1 watt for operators and 4
watts for leads) If you don't hear anything, don't yell at me about
it,
you just aren't patient enough!

151.895 20,000 Leagues Under the Sea *
452.650 Cash Control (Wells Fargo Trucks) *
463.975 Custodial Base (EC and MK)
469.3375 E - Stops (Attractions) *
148.100 E-Stop Great Movie Ride *
462.550 Entertainment 1 (Characters)
461.300 Entertainment 2 (Parade Dispatch/Traffic)
464.9375 Entertainment 3 *
464.500 Entertainment 4 (Special)
453.825 Fire Channel 1 (Reedy Creek Fire Rescue)
463.750 Hailing (Disney - MGM Studios)
464.125 Hailing (EPCOT Center)
464.400 Hailing (Magic Kingdom)
154.47875 Light Barges (Electrical Water Pageant) *
462.675 Maintenance 1 (EPCOT Center)
464.625 Maintenance 2 (Magic Kingdom)
464.800 Maintenance 3 (Disney - MGM Studios)
462.650 Operations 1 (EPCOT Center)
462.575 Operations 2 (Monorails)
462.625 Operations 3 (Magic Kingdom)
461.600 Operations 5 (Disney - MGM Studios)
464.600 Operations Simplex *

157.740 Pagers (no input)
462.775 Pagers (no input)
462.850 Pagers (no input)
464.0625 People Finder *
468.8125 Point of Sale Systems *
462.475 Reedy Creek Energy Services
464.200 Resorts 1
461.700 S.T.E.P. (Fireworks)
151.655 Space Mountain/Riverboats/Studio Trams *
451.500 VUT
461.3375 Warehouses 1 *
461.9125 Warehouses 2 *

Also, Disney is steadily moving a lot of stuff to a 12 channel
trunked system
in the 800's. Currently, Security, Resorts, and Watercraft (plus some
V.I.P's)
use the system. I've seen the charts, and most of the traffic will
move there
within the next few years. Also, Disney should be setting up a 900's
trunked
system also. So, many of t non-theme park frequencies may be moving
there. .

If you would like to know who to listen for on each channel, give me
a note
at:

Internet: cwagar@ducvax.auburn.edu
America Online: "YenSid1"
Fidonet: 3613/13.20 (I think...)

Also, if you have any good frequencies to trade (especially State of
Florida
or
Alabama) drop me a line. I spent a good part of my summer sitting in
Walt
Disney World searching for frequencies... I'd like to think that
someone
appreciates it......!

Well, that's all I have (and that's alot!). Happy Scanning....!

You should try the attenuator on the PRO-2006. It may push the noise
floor down far enough to enable it to hear that weather station.

Depends on what band. The PRO-2006 (and 4 and 5) are prone to desense
from strong local signals on the VHF high band. Using the attenuator with an
outdoor antenna actually IMPROVES reception in that band.

RA> for a 2006 base or should one have both types?
RA> Thanks!!

Hi, Robin...This will answer your first qustion.

Product: Realistic PRO-46 by Radio Shack
Purpose: Restoration of full 800 Mhz coverage

The modification of this unit is from the May, 1993 issue of
Monitoring Times, published by Grove Enterprises.

** Disclaimer: All modifications are done at your own risk. This
product uses surface mount components which can be easily damaged.
Do not perform this modification if you are not experienced with
this type of circuitry. This will void the warranty of your scanner.

** Listening to certain portions of the 800 Mhz band is prohibitted
by United States law.

Modification of PRO-46 for full 800 Mhz coverage with 30 Khz stepping
available.

1. Remove the battery pack, battery door and antenna.
2. Remove the four black screws from the back of the radio, then
push upward on the bottom of the rear of the case, carefully
swinging it upward and removing it.
3. Carefully insert a small screwdriver between the two boards
next to the interconnect plug in the lower right corner. Gently
pry the top board up to separate it and set it aside.
4. Unsolder the copper-coated plastic shield from the microprocessor
and set it aside. ** CAUTION!! Too much heat will damage the
shield. **
5. Locate the two chip jumpers imprinted with "0". Carefully unsolder
and remove both.
6. Solder one chip jumper across the two upper most unused solder
pads. (Soldering a jumper across the lower two pads changes the
30-50 Mhz band to 68-88 Mhz.)
7. Reverse steps 1-4. The modification is completed.

Speaking of the PRO-2006, we know about how to clip two diodes to
do a "frequency restoration" and "scan speed increase".

There is a THIRD diode, I think designated D504, that is either IN or OUT
of circuit depending on where you live. Much like the one that
does the Freq. Restoration, it appears to affect access to a memory
in the GRE-whatever chip.

If I recall my info. correctly, the US versions do NOT have the diode,
but many of the overseas versions DO.

Does anyone know what that diode controls?

zlau@arrl.org (Zack Lau (KH6CP)) writes:

(Dave STark wrote about the stupid scanner law)

>Thus, what exactly is the impact on amateurs?
>--

IMHO, directly, there isn't any. BUT - as I have said before
the scanner law and ECPA set horrible legal precedents for allowing
big-money corporate lobbies to yank more and more frequency bands from
public use.

By not more vehemently opposing it, ARRL has essentially
given its OK, at least in my opinion; and ignored the future
possibilities.

Since we hams are not a "big-money lobby", just who does anyone
think will be the likely first victims? We've already been assaulted on
220 MHz, it is likely to happen again somewhere else and the MORE it happens
the HARDER it will be to stop the whittling away of our spectrum.

>Jim Kearman
>Member, ARRL and NRA, and inveterate legislator-caller

Hi Jim - I'll bite on your question.

I contacted my Senators, Lugar and Coats on this issue. Lugar kind
of hem-hawed a bit, making me wonder if he might have actually voted FOR
the f***ing thing.

Coats, on the other hand, had NO qualms about telling me that he was
DEEPLY opposed to the scanner ban. So if you're looking for a Senator
to help start the "repeal bandwagon" rolling, Coats will be a good
place to start.

And Jim - you'll be happy to know that wb9omc is now an NRA member.
But you *still* won't get me into the ARRL, for the short term.... :-)

Now ARRL will start looking much MUCH more attractive if they start
working to repeal BOTH the scanner law AND the ECPA, which I
have now nicknamed:

the "Electronic Communication Piracy Act"

which I consider an act of outright piracy by the Congress and the
big-money lobbies that bought it into law.

In article <1994May10.154405.20943@wdl.loral.com>,
Harry Salvini <salvini@wdl.loral.com> wrote:
>I am compiling a list of state/municipalities that "claim" scanners
>are illegal.

To which Bill Sohl<2qqp3o$4gb@dancer.cc.bellcore.com> replied:

SH>Outright bans on monitoring (possession of scanners) in automobiles:

SH>Florida*
SH>Indiana
SH>Kentucky*
SH>Michigan
SH>Minnesota
SH>New York

SH>In contrast several states prohibit the improper use of information
SH>heard, but do not prohibit the equipment and or the actual listening
SH>to police frequencies. They are:

SH>California
SH>Minnesota
SH>Nebraska
SH>New Jersey*
SH>New York
SH>Oklahoma
SH>Vermont
SH>West Virginia

SH>Note that NY and MN are on both lists.

Now I'm confused. How can a state be on both lists (i.e., ban scanners
outright AND only ban improper use)?

As for New York, my reading of the Traffic Code indicates that hams have
a waiver to allow them to use transmitters/receivers only on amateur
frequencies.

"Nothing in this section shall be construed to apply to any person who
holds a valid amateur radio license issued by the Federal Communications
Commission and who operates a duly licensed portable mobile transmitter
and in connection therewith a receiver or receiving set on frequencies
exclusively allocated to duly licensed radio amateurs." - New York State
Vehicle and Traffic Law, Article 12, Section 397.

To me, this is a far cry from saying someone who holds a ham license can
use a scanner in his car!

Hello. I am looking for some comparisons between the Pro-2006 and the Pro-2032 base scanners. I realize that the first has 400 channels and the second has 200. However, my desire is for more technical information like how do they compare when recieving signals? Is one much better than the other?

E-mail or a news reply is OK with me.

Thanks.

Well in my manual it is documented. I may have been around
radios a bit, and perhaps have found an undocumented feature
or three, but I cannot lay any claim to this. My manual is the
Japanese one, and it took a bit of effort, but it is there
for sure.

I have another R100 with an English manual but honestly I
have not even tried to look it up in it nor have I attempted
to compare the two manuals to see if there is more in the Japanese
versus the English manual.

One thing I have noticed is that the radios work differently.
My Japanese R100 (purchased in Tokyo) displays the clock while
off. My Hong Kong purchased one (with the English manual)
does not display the clock while off. Maybe one of you guys
that have carefully studied the manual can tell me how
to have the clock display when the radio is off?

BTW the Japanese purchased radio had the cell bands
blocked as well as the Japanese cordless bands. I did the
mod to open it up and now it is full coverage.

On the bottom of the back, on the same side of the radio as the
tuning knob is a three-position switch for the clock, labeled
Off-On-Lamp.

Hi there,

I have a Regency 4030 handheld and I was trying to find an adapter for its earphone jack so I could use headphones instead of the supplied earplug. The jack is unusualy small, smaller than the 3.5mm jack on most radios. Does rat shack have what I need? (part no?) I have tried a few places and they dont have the proper adapter. Thanks.

>market.)

Yes indeed, there may be other developped countries in the same
situation
but i don't know wich ones. The WARC (ITU) 1992 has officially adopted the
L
Band (1452-1492MHz) as the worldwide band for DAB radio. And the americans
don't want to use that band but prefer to continue to use MW and FM bands
for
DAB. Two main arguments for using this new band for DAB is the bandwith
available and the ability to receive also from satellites. Hence the actual
DAB standard is a data flow of 1.5 million bits/sec compressed to .25
million
bits/sec using a bandwith of 1.5MHz per stereo service (6 services per
channel). So, that standard is unapplicable to the MW band(0.01MHz bandwith)
and the FM band (0.25MHz). That's why americans must develop a different
standard. Acording to the Canadian plan all MW and FM broadcasters should
have migrated to the L band by 2010 sharing all the same audio quality and
extra services(too long to explain here).

Extracted from an Industrie Canada leaflet printed in 1993 is a view of
the american position on DAB. This was written by the work group on DAB

implantation, consisting of representants of broadcaters industries and government.

" Why the USA does not adopt the L Band for DAB?

Actually the L band is not available for DAB in USA. Besides, many american broadcasters are opposed to it's use because they maintain that DAB in the L band is a menace for existing radio stations. Acording to these broadcasters, the introduction of DAB radio stations working on the L band would create a third band added to to MW and FM. The stations operating in this new band, in wich audio quality would be superior,
would grab some publicity revenues to traditional AM and FM stations who already have difficulties to make profits in a saturated american market. To overcome the menace posed by DAB broadcast in the L band some american
companies and broadcasters are jointly working on a DAB standard that could be operated in the MW and FM bands.
They have yet to proove that the proposed standard, known as IBOC (intraband in the lane (my translation)) could be exploited satisfactorily as
well in the MW and the FM band. We cannot dare say there is no solution in this avenue, but many international experts doubt that this american initiative can produce real improvements. Most countries want their future digital services to be coming as well from earth based transmitters as satellites. In view of the propagation caracteristics of the MW and FM bands the IBOC system won't be usable by satellites.
The problem is that even if the IBOC system could work well in labs it might not be so in real world. It might not overcome the problems of fading and multipath linked to FM transmission. So it is unlikely that the IBOC system's efficiency would surpass analog FM enough, specially in the case of car reception.
For the MW band even with the reduced need in bandwith arising from data compression the band isn't wide enough specially if you have to transmit as well the traditional MW service along with IBOC services. Besides at night there are serious jamming problems due to other stations that could cause an important degradation of DAB broadcasts in this band.
Consequently it is likely that any feasable IBOC exploitation would be in
the FM band to the detriment of MW stations. Then the actual inequalities between MW and FM stations wich made havoc to MW stations exploitants in the unregulated US radio market, would only increase if such a solution would be retained.
IBOC cannot offer real improvements to broadcasters and listeners. And obviously, if the listeners don't beleive taht DAB is realy superior they will buy the radios. "

Actually some of the long term tests are going on here in Montreal. If i could tune to 1468.75MHz i would hear the digital broadcast of 6 local stations repeated on the same channel. 10 prototype receivers made by the Eureka 147 consortium(Phillips, RCA-GE, Telefunken and Grundig) are in use

somewhere around the town. The first production models should appear in 1995.
Other companies: Pionner, Sony, Kenwood, and Delco have asked for licences. It is expected Delco (a GM subsidiary) will be a big player in this field since it is making half the worlds car radios, and the rate of renewals of cars is quite high and the fact that 55% of radio listening is done in cars make the car radio the major port of entry of DAB.

Source record: 274145

Hey all,
I just acquired a PRO-51, for Radio Shack. This is my first scanner, and I was wondering about a couple things. First of all, is this indeed better than the PRO-46, or perhaps the numbers don't really matter? I am gettting some cellular calls, but there are a lot more blocked, like 870-894Mhz. I heard that this particular scanner is not modifiable(after I bought it). Is this true, did I screw up? I just bought it a couple days ago, so I could probably bring it back and exchange it. I want to be able to do the mods to unblock the *cool* stuff.

thanx for any help

4006. 494.937 Cable Service?

Newsgroup: rec.radio.scanner
Date: 1994-05-21 22:30:58 UTC
From: peter_thompson@walnut.prs.k12.nj.us
Message-ID: <2rm232$d32@c3po.jvnc.net>
Source record: 274152

I recently ran across activity on 494.937 in the Princeton NJ area- the traffic is obviously a Cable TV company service fleet. What is weird here is that I have the entire NJ FCC database on hand, and fail to find any frequency like that in use. OK, OK. I hear you- Images. It must be a multiple of the IF on my BC 760xlt. So I try increasing and decreasing the frequency in steps of 10.7 (and 10.3 since I couldn't quite remember) Mhz. I did find other traffic on some multiples, but not this same frequency. I appear to be hearing the repeater output, as both the base and mobiles are there.

So- is there any way to tell if I am hearing the correct frequency or an image? I am also probably misunderstanding how the IF multiples work: what is the correct way to determine the actual frequency?

And finally, is 494.937 actually licensed for business use perhaps? Is there a good source for the FCC allocations somewhere?

Anyone
>know what base Northern Lights refers to? How about callsign
November?
>Thanks.....Les

I heard the same comm here in N.E. Ohio. I believe the aircraft you heard was an E-3 because later on in the comm the female referred to herself as Darkstar November - Darkstar being an E-3. I was stumped by the November callsign myself until I heard Darkstar.

BTW, I have been monitoring these comms for the past month. They usually occur between 7 and 11 PM EDT. They can usually be heard 2-3 times a week.
I am curious, how strong was the signal there? It was pegging my signal meter here at +15 to 20 dB.

As for where Northern Lights is located your guess is as good as mine. Judging from comms I have heard in the past it may be Griffiss AFB, NY (N.E. Air Defense Sector).

4011. Sony SW100 Questions

Newsgroup: rec.radio.scanner
Date: 1994-05-22 02:51:54 UTC
From: nunas@solomon.technet.sg
Message-ID: <2rmhca$njr@raffles.technet.sg>
Source record: 274160

I would like some advice on a shortwave radio. I have been looking at a new Sony called the SW100. It appears to be a replacement for the SW1, being about the same size. It has many more features though and opens/closes like a clam shell.

I have experience with a Sony 2010 (2001D in asia, I think) and a Kenwood TS450 amateur radio transceiver. I liked the 2010 but found it too heavy and too large. The TS450 is not portable.

The SW100 has a lot of features I like:

Synchronous detector, like the 2010. This I used a lot to pull in stations when there were strong ones nearby.

Sleep/wake up, like the 2010 but not as good, nice when travelling.

Memories, nice but not essential.

So, why am I putting this on the Internet and risking getting flamed? ;-> Well, I have only seen the SW100 in stores. I have never used one or talked to anyone who had any experience with one. In the stores, there is so much concrete and noise that I cannot receive anything.

To make matters worse, Sony does not publish specs. So, I cannot tell what the sensitivity and selectivity are like. Does anyone out there know how the SW100 fares in this regard? Either in terms of specs or in A/B as compared to the 2010 or TS450?

Does the synchronous detector really work?

The SW100 comes with or without accessories. The accessories are a Powersupply and an active antenna. How long do the batteries really last (yes, I know Sony provides figures, but really . . . what is the experience)? Is the active antenna useful or should I just buy the bare bones receiver?

WRT price, the cost here in Singapore is about $350 for the basic model and $440 for the one with accessories; that is about US $220 and 275 respectively. What is the cosst in HK or the US where these things are usually a tad cheaper? (I can probably talk them down a few $$ here as we dicker for everything here in S'pore!). Is the Difference in price between the basic and full pkg worth the price difference?

Where on internet or elsewhere can I find reviews on the SW100?

This is my first message on the Internet newsgroups, so I hope this comes through OK!

Maurice Nunas, from the land of endless summer.

4012. SBE OptiScan programming info needed

Newsgroup: rec.radio.scanner
Date: 1994-05-22 06:27:19 UTC

No, 494.0 - 500.0 is allocated to UHF TV channel 18.

So far your impressions are correct.

>;-> Well, I have only seen the SW100 in stores. I have never used one
>or talked to anyone who had any experience with one. In the stores,
>there is so much concrete and noise that I cannot receive anything.

Fine. This is a perfect reason to post here. Don't worry about flames.

>To make matters worse, Sony does not publish specs. So, I cannot tell
>what the sensitivity and selectivity are like. Does anyone out there
>know how the SW100 fares in this regard? Either in terms of specs or in
>A/B as compared to the 2010 or TS450?

I think we're in the same boat here.

>Does the synchronous detector really work?

Yes it does.
It locks easily and stays locked. It adds to intelligibility, although the
noise level on weak signals does rise slightly. It also helps dramatically
to reduce adjacent channel interference from one side or the other.

This sync detector design is TWO GENERATIONS NEWER than the one on the vaunted
2010.

>The SW100 comes with or without accessories. The accessories are a
>Powersupply and an active antenna. How long do the batteries really last
>(yes, I know Sony provides figures, but really . . . what is the
>experience)? Is the active antenna useful or should I just buy the bare
>bones receiver?

People have reported 15 hours, or so. I've had different sets of batteries
in and out of mine, so it's hard to give an absolute estimate, but it
sounds right.

If you don't have an indoor or outdoor longwire, get an active antenna.
It does not produce dramatic results, but it is definitely better than the
whip.

>WRT price, the cost here in Singapore is about $350 for the basic model
>and $440 for the one with accessories; that is about US $220 and 275

>respectively. What is the cosst in HK or the US where these things are
>usually a tad cheaper? (I can probably talk them down a few $$ here as
>we dicker for everything here in S'pore!). Is the Difference in price
>between the basic and full pkg worth the price difference?

The SW-100S (accessories) package goes for about $350 in the US.
The SW-100E package in not distributed in this country.

>Where on internet or elsewhere can I find reviews on the SW100?

I will mail my file to you.

>but "dead" static. What gives? Is my new '43 a dud? Or is there a
>logical explanation for this?

You don't hear anything because the PRO-43 is a better radio. It
has triple conversion instead of double conversion. What you are
hearing does not exist on the frequency you punch in, but is an
image of the true frequency about 20mhz away in the blocked out
cellular frequencies. The PRO-43 can be modified to unblock the
"true" cellular frequencies. Just involves removing a diode.

Your Pro 36 is probably receiving a mirror and not the intended frequency. The Pro 43 is a much better radio. Triple conversion will reject mirrored and intermod much better than the 36.

4019. open mike on 800MHz

Newsgroup: rec.radio.scanner
Date: 1994-05-22 16:48:11 UTC
From: me <PJB113@psuvm.psu.edu>
Message-ID: <94142.124811PJB113@psuvm.psu.edu>
Source record: 274169

Could someone please tell me what is going on with an open mike on 858.2625MHz in the State College,PA trunked system? This frequency stays open, so I locked it out and then when there is talk on this channel I miss it if I just use one scanner. Luckily, I have two 800MHz scanners so it isn't a problem for me. Note that i'm not talking about the control channel!! The control channel has always been different from 858MHz since I noticed this garbage.

Is there anyone else out there who experiences the same type of problem with your trunked system? I suspect that it was intentionally done to screw scanner users up.-PJB

: supply and perhaps increased demand (buy now or never) to cause
: new and used prices to heat up?

Naw, not so far. I have received numerous requests in e-mail for the overseas supplier addresses and phone numbers (Canada, UK and Germany).

I am in the process of making such a listing and will post it here soon (for the curious).

There is no problem getting units that can receive cell-calls, since when they dry up here, it is simply a case of calling a little longer distance to get one.

To those companies who may have thought you can not import for purposes of resale, it was recently pointed out to me that the following holds true:

Under new FCC rules, it is legal to import receivers with cellular capability easily restorable or already restored, if the purpose is for export.

It was further explained, if you stamp the invoice "For Export Only", it legally shows your intention was in fact to make a sale for export purposes.

Now if the purchaser, whom obviously was "buying for export purposes" from you does not actually do so, he may be breaking the law, but it would be him and not you since you covered yourself when you made sure the paperwork showed your intent was selling to a third party for intention of export.

But, if this third party is not in the commercial business himself, the FCC has no way of knowing. Therefore there can be no enforcement.

EEB probably should look at this angle, they could make a mint on future sales!

Where there's a will, there's a way!

If I understand the Minnesota law correctly, you cannot have a radio capable of picking up a police frequency in your car unless you are a licensed radio operator.

You may be able to transport it if it is in the trunk out some such (sort of like transporting alcohol).

What's the serial number? (It may be worthwhile for others to post
candidates for the highest serial number of
a modified unit. I've been told serial numbers through 52,000 are modifiable
and I've seen units (modification status unknown) well into the 60k's before
April 26.

Cellular Security Group advertises an unlocking service (508/768-7486).
I have seen some good things about them on the net and have had a good
experience myself. I have not seen anything negative about them.
Others may wish to comment.

However, many units manufactured for overseas markets lack features that are
standard in US models (e.g., CTCSS encoding and decoding). By the time you
figure in the cost of adding these features, you may find that the
price *has* gone up.

How about the VR int. (bad contact or dirt on brush)? How long
does the scanner used?? Does the noise come out from some
specific points when turning the knob???

This is one of the reasons the PRO-2006's have a Sound Squelch. When
activated, after it stops on a frequency with a carrier, it then briefly checks
the freq for modulation. If there's none present, it continues scanning. Very
helpful for listening to Detroit PD's 453Mhz system, where repeaters stay on
for minutes at a time.

The other day I was listening to the local police who were searching for some bad guy in an old green Chevy truck. My wife was leaving to run an errand, so I said, "If you see an old green Chevy truck, stop and call the cops." I was just kidding around, but that got me wondering if the police ever get help from people who are monitoring on their scanners. It seems like the trend is for the government to try to restrict scanning of police and similar frequencies, with the idea that it is harmful, but I'd bet that sometimes it has been helpful to have people listening in--especially when they're looking for someone.

My wife never saw the green Chevy, but I would be interested in hearing about it if anyone has ever been able to help the police thanks to some-thing they heard while scanning.

I've gotten varying responses. While driving around one day, I was listening to some traffic about a guy who had brandished a pistol at the local Salvation Army. They gave a good description of the guy, the most notable feature of which was that he was walking around talking to himself, and to signposts. Anyway, I saw the guy and went to a payphone, and the dispatcher sounded annoyed that I had called. I heard her broadcast my info that the suspect was "supposedly" in such-and-such and area, with a tone that implied that she didn't think this was reliable info. I've also had a dispatcher act this way while I was calling in a reckless/drunk driver on ham 2-meter autopatch. I got the impression they thought I was sticking my nose in where it didn't belong.

While not directly scanner related, I've twice had the same kind of frustration calling 911 dispatchers.

I once called in a roof fire I could see about a third of a mile away. I could see it because my house was somewhat higher than the others. I was asked for the address, but couldn't give the number. The dispatcher could not understand how I could see the fire but not know the house number. My explanation didn't suffice, even though I could accurately describe the house. No fire assistance came. The owner finally put the fire out himself.

Another time I lived in a two-story condo right next to a freeway (not recommended!). I saw an multilple-vehicle accident one rainy evening commute and called it in. Was I on a car phone? Nope. Well, how could I see the accident? When I explained, there was a pause. After a second caller (going by what I heard on the scanner), they dispatched. There were injuries.

I guess they get a lot of crank calls, but I don't see why it should be such a wrestling match when you call in.

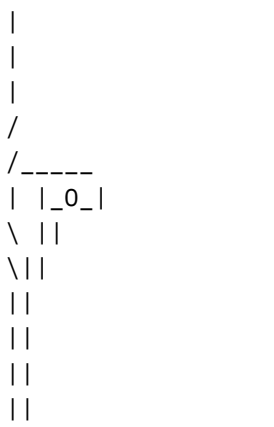
hello,

Does anyone know anything about the video cameras which are being installed on the major freeways around Houston, TX? They are mounted on poles and have an antenna about half a meter in length. I know these are being installed by Metro, but they are not very forthcoming with information about the system.

They look a bit like this: (Note the distinctive antenna)



All I know is that they are video cameras and they transmit over radio frequency. I don't know if they are color or black and white, live video or slow scan, what their low light characteristics are, or what their video feeds are actually used for.

Anyone know anything?

thanks,

Dwayne Fontenot

b>I am a newspaper reporter, about to be posted to the Middle East, and
b>I want an
b>easily portable shortwave radio for listening to BBC, Israel Army
b>radio and so on.

Bart,

Some years ago, I took several long business trips to Israel.
At that time, I carried a Sony IC-2010 with me. For a suitcase
portable, I can highly recommend this radio.

In addition to a fine SW broadcast receiver, this radio also
lets you listen to the VHF-aircraft band. This feature is really
handy for those long layovers. (If you fly TWA to Tel Aviv, you can
expect up to a five hour delay in Paris.) The SSB performance is
more than acceptable, save for a front end that overloads easily,
if you'd like to check out the HF aircraft and utility bands, or when
you have a weak SWBC station to pull out of the mud.

This radio is relatively inexpensive and very rugged.

Good luck on your trip. Keep your head down!

Best,

Tom Lackamp - San Mateo, Ca

So what's the deal with the front mounted earphone jack on the AR3000A? The rear speaker jack works fine for an earphone, but the front jack is not normal. If I plug it all the way in, there is no sound. If I pull the plug most of the way out it will work, but then it pops out. Is this jack non-standard? I tried stereo headphone and it works on one side. Am I supposed to get earphone with a short plug?

I don't know if this helps any, but I was looking for cellular control channels very near the tower once, and I noticed that my Icom 2SRA would show a S-meter reading higher 10KHz off frequency. I'm not sure exactly why, but I assume it was because of de-sense. If you are too close to the transmitter, that might be one explanation of your findings.

My guess is that one of your radios may be mis-aligned.

: And Jim - you'll be happy to know that wb9omc is now an NRA member.
: But you *still* won't get me into the ARRL, for the short term.... :-)

We'll just have to get along without you, I guess.

: Now ARRL will start looking much MUCH more attractive if they start
: working to repeal BOTH the scanner law AND the ECPA, which I
: have now nicknamed:

: the "Electronic Communication Piracy Act"

Gee, you mean you'll honor us with your thirty bucks if we will
just support your sacred cows? There's no reason why the HT
manufacturers can't continue to include 850-MHz coverage while
blocking 868-896 MHz coverage. Radio Shack scanners do it, why
can't the HTs?

Sorry, nobody has convinced me that there's any reason for ARRL
to work for repeal of ECPA or the scanner ban. You can rest
assured that, even without Wayne, we will continue to diligently
represent Amateur Radio interests, as we have for over 75 years.
With any luck, we'll also avoid sticking our noses where they
don't belong.

Why doesn't somebody start a national scanning organization to
represent scanner owners?

In DC, these cameras are al over the place. For the morning/evening
newscasts, you can see the images from these cameras. They monitor rush
hour congestion. As far as I can tell, they are live video, B/W. I have

no idea how the video signal is transmitted.

Anyway, stay tuned to local news when the system is up and running.

I find the best way to verify frequencies is to tune in with a second radio (different brand/model) and see if the signal is still there. You could be receiving an image of a harmonic!! (there are lots of possibilities).

I have personally assisted with 3 incidents, all involving drunk drivers who the police were searching for. One, in particular, had done considerable damage to numerous parked cars. I also have a cellular phone, so the call was an easy one to make.

FCC hasn't been able to define "easily modifiable" too clearly,
but they did mention that clipping diodes or cutting out resistors
to open up the frequency range would be considered "easy."

A multipin MPU soldered to a circuit board MIGHT be considered too
hard to replace for most people; one that dropped into a socket
wouldn't be hard to replace.

A technically oriented net.reader should prepare an article NOW
on how to replace surface-mounted ICs, and send it to MT or
Pop Com (or both!). Just make it look hard....

Good listening.

One night (actually about 2AM) I was heading home and there was a car ahead of me. The operator acted in a drunk manner, weaving etc. In the distance, a town police cruiser had a vehicle stopped. The drunk driver didn't seem to notice the squad, and the officer (who was speaking to the stopped driver) had to jump away to avoid being hit. I then followed the drunk driver for a while. In a short time, I saw the town squad in my rear view mirror and recognized the officer from high school. I then picked up my ham radio, dialed the county dispatch on the autopatch and told the operator, "This is Winnebago RACES operator 69, if you would, notify X-Ray 52 that the vehicle two ahead of his is the one that he is looking for." Her response was "Ah, okay, thanks for calling." I then switched the radio to the police freq in time to hear "X52, be advised that the vehicle two ahead of you is the one you want." He said, "Huh? Oh, I get it, 10-4." And, it took all of about two seconds for the old red and blue to go on and the squad car to fly by (with the officer giving me a wave.)

So, that is sort of a scanner story.

And, I am going to send this to rec.radio.amateur.misc (as well) for comments on proper use of autopatch, etc.

I work in eastern Mass and currently have a Yaesu FTH-2070. I'm looking to replace it with a new portable. I'm looking for something that will scan certain preprogrammed frequencies, as well as broadcast on the freqs that are owned by the people I work for. Preferably this new radio would be keyboard reprogrammable, but computer IF is alright (assuming it's available here, unlike the one for the Yaesu...). Any ideas?

I live in Colorado Springs, and they just put some cameras out by the Air Force academy. From what we have been able to get, they film you with the first camera, then film you at a second camera further down the highway. Then they compute how long it took for you to get there, dtermine if you were speeding, and if so they have your liscense(sp) plate number on film; you get a nice speeding ticket in the mail a few days later. Apparently this is all computerized. Quick, and safer for the cops. A number of them have been hit on I-25 while giving tix, this way they don't have all the expense involved with human monitoring of the traffic. Also, the cameras are used to monitor spots deemed unsafe on freeways, to see how accidents happen.

hope this helps a little...again, this wasn't officially announced or anything, so it is somewhat subjective!!

From: tsa@cellar.org
Message-ID: <05Rsmc3w164w@cellar.org>
Source record: 274123

I have a Scanner and a pager, and I noticed the frequency listed on the back of the pager, so tuned in. I heard the beeps and scratching of digital data being transmitted. Recording to disk and looking at the waveform, parts looked like a stereotypical bit stream, with 1s and 0s showing on the amplitude.

I'd like to be able to extract from the audio data the pager serial # and information, so I could have the computer know when I receive pages. Does anyone know the format of this data? What's FSK?

I once called the local sherrifs office to relay an ambulance call into their dispatch center.

The ambulance was obviously in a dead spot that the SO's satellite receivers couldn't hear. I could hear him calling his dispatcher several times. I phoned the dispatcher and the dispatcher was able to hear the mobile via our telephone connection. The base to mobile link was fine, so the dispatcher listened to his ambulance on my scanner and talked back out on his transmitter.

Another example where "in the clear" was to the SO's advantage.

Well, they have the tape and you don't. Unless you taped the call
too. I guess erasing parts of the tape isn't too difficult for the
dispatchers. In any case, I would feel I was going way out on a limb
in trying to pull such a "Rodney King" stunt on them without a proof
of my own.

> [bug in released software]

Nahhhh - software _never_ has bugs... :-)

Please, elaborate on the bug on rec.radio.scanner!

Jeff

I received the following reply from Bill Check who developed the
product:

Well, the fellow says he has "the latest release" but he doesn't say
which
version. There are no bugs in the latest commercial release 1.3 of the
HB-232
software nor 1.0 of the CE-232. More than likely, that's what he's
using. If
he has the freeware release, then I'd need to know the version number so
I can
check. The freeware version was not released by me and I do not
officially
support it because of the bugs and slip-shod manner by which George
Steidley
prepared it in his slimeball effort to stick it to me. That version is
George's to support.....as you will recall his promise to do so
here.....and
you will note he's not been seen since.

George had no long term commitment to anything other than to cause
problems for
me. Whether he intentionally created the bugs in his shareware release
as a
part of that scheme or not, I don't know. Could have been an accident,
though
it doesn't seem so. Anyway, ask this fellow what release version he is
using

and I may be better able to advise.....

Bill

I don't think the original post was by a ham.

Anyway, once you go digital, there are all sorts of ways to scramble.
It was not clear to me exactly what the poster wanted. Books on
how to do a simple DtoA and AtoD conversion? Books on introductory
cryptography?? How to apply a digital bit-stream to an NFM modulator?
What do you want??

As I understand Part 97, it is illegal to encrypt on the amateur
bands if the intent is to hide or obscure the content of the
information. What if one's intent is just to "study" cryptography
as applied to RF communication? ;-))

Is this because there's so much existing stock that there's no need to release
a new model?

4086. Re: 494.937 Cable Service?

Newsgroup: rec.radio.scanner
Date: 1994-05-24 02:24:21 UTC
From: sohn@ccnet.com
Message-ID: <2rrogl$jh4@ccnet.ccnet.com>
Source record: 274039

: >And finally, is 494.937 actually licensed for business use perhaps?

: No, 494.0 - 500.0 is allocated to UHF TV channel 18.

494.9375 (like many other channels between 470 and 512 MHz.) *IS*
available for land mobile use in selected areas of the US. This is called
UHF-TV Sharing and is addressed in Subpart L of Part 90 of 47CFR (the FCC
rules!).

UHF-TV Channel 18 is used for land mobile operation in Pittsburg, PA and the
Washington/Maryland/Virginia areas. The particular part of channel 18
that includes 494.9375 is used in Washington/Md/Va. It is used by the
Public Safety Pool and the General Access Pool. This means that many
different kinds of users can license on these frequencies.

The systems in the UHF-T band use a 3 MHz split. The mobile transmits 3
MHz higher than the repeater. If you are close to one of the mobiles or
a control/base station, you will be able to hear the transmissions on
497.9375 as well as being repeated on 494.9375.

My info is from the October 1989 CFR Title 47. I would guess that it is
still accurate. If anything, more sharing is being done in more areas of
the country.

Eight or so years ago I took to Israel a 2010 and an early AOR with 800mz (don't remember # - it sat on a little wire stand). The 2010 was wonderful to have, but if you can only take one radio I would hate to be without VHF/UHF. I vote for the Yup 7100 if you are only planning to take one receiver - it two, you can't go wrong with the 2010 and any scanner with 800mz. BTW at customs the x-ray guy looked at me and said "two radios" I smiled big and said yes - he sent me through. The best source of information re: scanning out of USA/Canada is Rickey Stein (Rickey.Stein@illusion.metronj.org) He is the international editor for the RCMA.

I'm curently use a pro2022 with a small antena on the back (i have take out the antena that come with the scanner). I'm very happy with them except that with some freq i have to set the squelch to 0 to listen them (the freq. is used by the police far from me) since i cannot instal a outdoor antena i want to buy a "booster" that plug between the scanner and the antena (the guy said me that it's adjustable from 0 to 28DB). Is it a good solution? if not what could you sugest me on the same range of price (the booster is 100$ can. aprox. 70us$)

> anything, so it is somewhat subjective!!

This reminds me of the use of photo radar, and the debate over the
effectiveness of it. The major point of the debate was the camera would
take a picture of the car and license plate, and then cite the owner of
the car, who may not be necessarily the driver of the car. Normally, the
driver of the car is cited for a speeding ticket, not the owner. Hence the
debate...

Residents of some locale were using this 'loophole' to defy this method of
enforcement. It seems they wore Halloween masks when driving past the photo
radar units! The prosecution was unable to prove who was in the car, and thus
tickets were nixed. Nevertheless, the photo radar units ticket enough people
who don't know how to fight it, and thus it generates revenue!

Anyways, getting back to scanner topics... *grin*

I will be traveling to Witchita Kansas on Wednesday 5/25/94 and I will be bringing my Pro43 with me. I am looking for any interesting frequencies to listen to. Specificly, I would like state patrol, local police, and news media. I will be staying in Derby if they have their own police department. I will have a 4 hour layover in Denver airport. Anyone have good frequenceies to listen to there?

Please Email responces and I will post a summary to rec.radio.scanner.

Thanks

Well, I am really not sure about the laws in all states, but here in Oklahoma, there is some law that states you can't use ANY information gained by a scanner for personal gain...be it lawful or otherwise. I used to work for a police dept. and bought a scanner to listen in to the activities while i was off-duty. Anyways, my scanner also picked up cellular freqs. One day i overheard (by accident, mind you) an conversation that described in GREAT detail, exact plans for a drug deal that was going down that evening. Details like place, time, types of drugs, amounts of money, and how many ppl would be there. I immediately called dispatch and informed them about the drug deal and how i had received the info. I had pleanty of credentials with the dept (I worked there) and knew the dispatcher personally. But she told me that the information could not be used to help in the capture or arrest of the individuals I had heard...not even surveilance of the area! I said rather bluntly, "Couldn't an officer just ACCIDENTALLY be in the right place at the right time?" She said that would be criminal!!! (for an officer to use information gained on a LEGAL, non-modified BearCat 200XLT scanner from Service Merchandise to BUST scum-sucking ass hole that will be selling crack on elementary playgrounds next week...CRIMINAL!?!) I simply cannot understand that. I DO realize the importance of security and understand that these laws were written to help protect innocent people from being taken advantage of...but still, it seems wrong.

My point is, at least here, I have called the police on at least 5 occasions and each time they tell me that nothing can be done. So..I quit. I hope that some states Do allow you to report things that you hear, no matter what freq. you hear it on...

```
|> This may be a regional thing, because I used to live in an 18 story building
|> that overlooked several freeways in Milwaukee, and the dispatchers there were
|> always grateful acting...

Could be. I was almost run off the road by a woman driving
recklessly once so I attempted to follow her short of
becoming reckless myself (I didn't follow her as she
passed on the shoulder of a one-lane-each-way roadway).
At the fastest, we were hitting the mid 70's in a 50 zone.

I knew she was heading into a town where all of the police
officers bought and installed cb radios in their own patrol
cars, so I began calling on 9. As we approached my exit,
I had just established contact with an officer and notified
him of her direction and potential location. We were separated
by mountains so the reception was going. The officer heard the
roadway and direction, but didn't get the descrip of the car.
I punched it to my house and immediately dialed dispatch.

"911 Emergency"
"Hi Hunterdon, I was just in radio contact with a 46 car--
I was following a reckless driver north on 31 approaching
Clinton Township; stand by for a plate."
"Go ahead."
"Pennsylvania, XXX-XXX, light blue oldsmobile wagon, one black
female occupant."
"Call back?"
"XXX-XXXX; thanks."
[click]

A few minutes later the officer I spoke with called me at my
house to thank me for sticking with her and calling dispatch
to make sure the details went out. He found her--she was
passing on the shoulder again as he was pulling up behind
her. He asked me to testify if she plead not guilty and I agreed.

He said he owes me one. I'd say that's grateful.;)

4098. Pro 43 problem

Newsgroup: rec.radio.scanner
Date: 1994-05-24 12:42:17 UTC
From: reda@gandalf.rutgers.edu
Message-ID: <May.24.08.42.16.1994.12528@gandalf.rutgers.edu>
Source record: 274036

I bought a Pro 43 a few months ago. All in all, I like it, but I have one complaint. In the range from 155-156 Mhz I frequently hear 'data-like' transmissions. They appear to be 'bleeding' in from adjacent freqs, because they are never actually clear on their own, and they only occur when I have legitimate carrier on any of the freqs in that range.

Can anyone tell me what this is? And, is this a function of the scanner's selectivity?

TIA,
FRank

Source record: 273978

Lake County (Ohio) has been using a similar device on their 800 Mhz trunking system. A radio programmed on an unused talkgroup, has the PTT line keyed for 1 minute and released for 5 seconds. The effect is a dead carrier that jumps around on the system, requiring the scanner listener to lock & unlock a channel every minute. The Radio Shack 'sound squelch' is quite effective aginst this device, assuming that you can receive the trunking system without noise or statioc.

4104. Helping cops by scanning-

JOHNSONK@YVAX.BYU.EDU asked:

J>My wife never saw the green Chevy, but I would be interested in hearing
>about it if anyone has ever been able to help the police thanks to some-
>thing they heard while scanning.

Well, let me start of with the fact that I am a career firefighter. I
was with my friend, who is a paramedic at an area hospital. We were
riding around town one night in his truck, when information came over
the radio about a theft of gas from an area gas station. The information
included a description of the vehicle and the occupant.

Immediately in front of us was a vehicle matching the description, with
the exception of a digit was off on the license plate (I am in PA, the
reg was from NY). We called the 911 center on his cellular phone,
identified our selves, and gave them the information on the vehicle,
including the description and location of the vehicle.

We followed the vehicle until it turned onto a dead end street and
stopped. We drove past the vehicle, and advised the dispatch center of
the vehicle's location. The police arrived less than a minute later, and
the man denied being at the gas station. The man then followed the
police to the gas station, where he was positively identified, and
arrested.

We also detained a man fleeing from the police one night, but the
scanner wasn't involved. That was in my friend's front yard at 2 a.m.

4105. Freeway Video Cameras (Ho

DSE>I guess they get a lot of crank calls, but I don't see why it
>should be such a wrestling match when you call in.

Not that I want to defend, but, I was a communications specialist at our
county 911 center for three years before getting hired by the City Fire
Dept.

I don't know how other areas are, but in my area, 911 dispatchers are
usually over-worked, under-paid, and put up with a lot of sh...grief.
Sometimes, it's just the luck of the draw as far as what dispatcher you
get, and how his/her day has gone so far. I don't think our dispatchers
treat callers too bad (unless the callers treat them bad), but sometimes
those of us in the field get it over the radio!

And, yes, when I worked there, we did get some strange callers!

In article <1994May23.125936.2164@arrl.org> jkearman@arrl.org (Jim Kearman (KR1S)) writes:

Sorry, nobody has convinced me that there's any reason for ARRL
to work for repeal of ECPA or the scanner ban. You can rest
assured that, even without Wayne, we will continue to diligently
represent Amateur Radio interests, as we have for over 75 years.
With any luck, we'll also avoid sticking our noses where they
don't belong.

Wow - what a narrow minded view. No wonder so many people are turned off
by the ARRL. Sure sounds like if your not a Ham you aint sh*t to the ARRL,
non Hams need not apply.

Why doesn't somebody start a national scanning organization to
represent scanner owners?

Because the ARRL has the history, organization and presence in political
circles to make a difference even in non amateur radio but nontheless
radio related interests. Seems a lot of people make the mistake in thinking
that Amateur Radio includes just plain listening radio to.

Well, I thought I would add my two cents worth. I just received my PRO-43 last week 5/16 (from MaryMac) and I successfully restored it the same day. It has serial No 074692 and it is a model 020-300.
To support spare parts they always (well almost always) change something in the model number when a significant change is made. They even made the 2006 an "A" modelin 1992 when all they did was change the display dimmer switch to an off switch.
Good scanning to ya'

I think you'll find that the "distinctive antenna" is a lightning rod, intended to route static discharges around the camera. That's why the rod has the distinctive shape.

```
|>All I know is that they are video cameras and they transmit over radio
|>frequency. I don't know if they are color or black and white, live video or

```

Dunno how the signal is transmitted, or even if it is (could be hardwired). Around here (DC metro area) they're used to monitor traffic congestion and road conditions. Sometimes you can find a cable-TV channel showing selected camera feeds.

True, no one can use what you hear as evidence, but if you
listen in on a police broadcast, find the guy they're looking
for and report it, there's no evidence in the broadcast.
On the other hand, if you're listening in on someone's
cordless phone conversations, hear something illegal and
report that, that's quite another matter.

Stan Scalsky (sscalsk@relay.nswc.navy.mil) wrote:
: In article <1994May23.125936.2164@arrl.org> jkearman@arrl.org (Jim Kearman (KR1S)) writes:

: Sorry, nobody has convinced me that there's any reason for ARRL
: to work for repeal of ECPA or the scanner ban. You can rest
: assured that, even without Wayne, we will continue to diligently
: represent Amateur Radio interests, as we have for over 75 years.
: With any luck, we'll also avoid sticking our noses where they
: don't belong.

: Wow - what a narrow minded view. No wonder so many people are turned off
: by the ARRL. Sure sounds like if your not a Ham you aint sh*t to the ARRL,
: non Hams need not apply.

The American Radio Relay League was founded in the early years
of this century to support the person interested in TRANSMITTING.
During the broadcast boom of the 1920s, the League reaffirmed its
position as an organization devoted to licensed radio amateurs.
Hobbyists interested only in listening were not sought as members.

You may think us narrow minded, but that's the way it's spelled
out in the By Laws. To be a Full (voting) member you must have a
US amateur license.

Be that as it may, there's an ARRL employee on this forum, which
ought to tell you there is some interest in scanning matters
here. In my earlier posting I started to say that the NRA has
more in common with scanner owners (in regard to the ECPA) than
does the ARRL, but I didn't. Consider it said. Sorry, but I don't
think it's an ARRL fight. If we got into this one the broadcasters,
CBers, Public Service agencies etc would all want us to side with
them in their dealings with FCC.

Some other national ham organizations have SWL members, but I
know of no cases where these organizations supported scanner
users in any dealings with the national communications
regulating body. For example, the German society (DARC) has
not petitioned their regulating agency to allow full-coverage
HF receivers to be sold in Germany, as far as I know.

: Why doesn't somebody start a national scanning organization to
: represent scanner owners?

: Because the ARRL has the history, organization and presence in political
: circles to make a difference even in non amateur radio but nontheless
: radio related interests. Seems a lot of people make the mistake in thinking

: that Amateur Radio includes just plain listening radio to.

That's the way the League is organized. Changing it involves becoming a licensed ham, JOINING, and lobbying for a change. Frankly, it wouldn't bother me to have SWL/Scanner hobbyists as members. It would sure broaden the scope of the articles we could run and the equipment we could review! But the charter of the organization is what it is. I'm not diminishing scanning or scanner hobbyists when I say that; merely reporting the facts.

Licensed hams who are members but not interested in SWLing or scanning might not take kindly to expanding the League's membership and involvement to include receive-only hobbyists. That's why I think it would have been best if some scanner-oriented organization had taken up the fight.

Good listening.

Jim
Receive-only ham

That'd really be a copyright violation. Not that I care, but most sites
would probably refuse to have it around. I'll look for copyright
notices in the manual when I get one.

Wow, cool. Having not been in that situation, I wouldn't
imagine that giving the FCC rules that have been in effect since
the 1930's, that any court would permit cordless conversations
without a search warrant. I wonder if, in those cases, the
law enforcement types got a court order to record the conversations.

4120. Anyone own the MAX 800 from Cellular Sercurity Grp?

Well,

The case in question did NOT involve Law enforcment monitoring. The
Wife of the Attempted murderer (the murder-ee) was the one with
the recording.

All of this of course may be utter fabrication. I'm not sure.
Proceed at you own risk. Your mileage may vary. Not valid in
many states. Offer good will supplies last. You must be over
21 to enter...

Cool? Indeed!

As mentioned in some previous post, the RS 2006 may be a better choice
because of the "voice squelch" feature. This really works well on trk
systems (at least in my experience here in Dallas). Of course if your
influenced by other factors$$$$...

Does the BC 890XLT or BC8500XLT have anything like this? (continue
scan if no modulation).

If you are near a transmitter (FM/AM/POLICE...) you may have seconds
thoughts on the uniden. It is very sensitive, but that causes it to
overload and lockup in a city environment with close by transmitters.

The GRE line at radio shack (PRO-2032,PRO-2030,PRO-2006) are not quit
as sensitive, but very tough to overload the front end (lockup) in a
city environment. Also the GRE line have the right cellular spacing
if you plan to restore it, all unidens have the wrong cellular spacing.

Perhaps they were able to use it because it was a phone
conversation- and taping those is perfectly OK as long as
one party in the conversation gives permission (at least
in many states). It's not likely that the murderer wanted
it taped, but the perhaps the victim-to-be did?

I'd also be curious to know why this guy's wife was listening
in her husband's conversation with a scanner...

Questions for those in the know:

1) Once a particular CTSS tone is determined for a trk system,
can that tone be programmed into the 456 for opening
squelch only when THAT tone is rx'd?
2) Is there any signal strength indicator?
3) Does the unit software have import capabilities?
4) Does the unit allow frequency decriptions?
5) Are the scanner controls defeated when the unit is
in use?
6) How much speed if any is added by this unit?
7) Does the software support IRQ base addresses for
multiple serial connections using multi serial cards
such as DIGIboards? (8 scanners, 8 serial ports, one
computer.)
8) Verify unmasking operation, please. (520-760, 823-851,
868-896) And, is any additional coverage beyond 1.36g
9) Is there technical support available?
10) Has a review of this system been done? If so, where?
11) Does this system enhance or add control of tape drives?

Thanks bunches for any help or discussion.

the police regularly use both cordless monitoring and garbage can
analysis for monitoring people, for, as we all know, whatever "trash"
you send through the airwaves (or place in front of your house) is
fair game for interception. they also use night vision scopes and
all kinds of neat stuff like motion detectors.

I know it's off the topic again, but I couldn't resist:

Hooray for those who were clever enough to get around a local/state government's attempt to collect quick and easy revenues. If they're that concerned about safety, why don't they simply use the money invested in such a system to put some more police on the road? The whole basis of our justice system is that one is innocent until *proven* guilty. The burden of proof, therefore, is on the government to prove that the person ticketed was indeed driving the car. A picture of a license plate (or even a car for that matter) certainly isn't proof enough that the owner of the vehicle was driving.

Enough for my $.02. Now back to your regularly scheduled rec.radio.scanner...

>available,I need one that improves reception in the 415.000 to 460 mhz,160-170
>mhz and the 800mhz areas.

I have the same problem, living in a townhouse I don't have the opportunity to mount an outdoor antenna...and I use a Pro 2006 with a MAX 800. I've found it to be a great combo and it really perks up the 800 MHz band...stations which were weak with either the standard whip on the 2006 or a rubber duck cut for 800 MHz are much, much stronger on the MAX 800.

The price seems outrageous, and I know people who have built their own versions of the MAX 800. But, the unit is well built and really helps. But, remember when you plug it in to the 2006 you'll certainly decrease the reception on other bands!

BTW, the difference between the handheld and tabletop versions of the MAX 800 is only in the connectors supplied. I've the table version which comes with a 90 degree BNC to PL259 adapter (which the antenna is built on).

Overall good antenna...I'd buy another one if I needed it!

Why not just place an anonymous phone call to Silent Witness or
something like that? That way, the police get the information, and
they don't need to know where it came from.

If you are looking for radio modifications, there is also the Oakland site:
oak.oakland.edu:/pub/hamradio/mods

From that point, it breaks down my manufacturer. There are a LOT of mods,
and I'm always looking for more!

While you are connected, feel free to check out the rest of the /pub/hamradio
area, too!

Scott

You've got to carefully maintain the distinction between cellular/mobile and cordless. The EPCA prohibits listening to cellular/mobile, *not* cordless. However, some jurisdictions--CA, in particular--have outlawed cordless, as well.

Also, what FCC rules are you referring to? It is well known among amateur radio operators that it is perfectly legal to listen in on others' radio conversations (and what are cellular/mobile/cordless phones if not transmitter/receivers?). It fact, it is legal, even if it's cheezy in some circumstances, for broadcasters to tape and retransmit amateur radio transmissions.

"When radios are outlawed, only outlaws will have radios."

However, the ECPA has had a very noticeable effect on the kind of equipment licensed radio amateurs can now purchase. You can't let yourself be blind to what's going on upstream if you want to be fully informed about the possibility of flooding.

With the use of scanners in our country (New Zealand) it is not illegal to monitor the police channels. I am a scanner nut, and have two scanners of which are going all day long. I have a UBC760xlt and a Yupiteru MVT7000. I have spoken to a few cops in the area, and they know I monitor the bands, and they have said to me that any help I can give them would be greatly appreciated. How ever, if I used it for illegal purposes it would be taken off me, I would be fined, and possibly imprisoned!
It is my understanding that it is illegal to listen to scanners in other parts of the world, I feel sorry for all those people.
I just hope people in this country dont abuse there scanners to ruin it for the likes of people like me.

Todd.

>"When radios are outlawed, only outlaws will have radios."
>--(someone said that)
The Communications Act of 1934 specifically prohibits disclosing
the contents of any radio discussion you hear, unless that broadcast
was intended for public reception. It's okay to talk about
something you heard on a Top 40 AM station but not okay to
discuss the content of a cordless phone conversation. The ECPA
further prohibits *receiving* cellular phones, and several states
(CA comes to mind) prohibit receiving cordless stuff. This all
applies to the US, although I understand other countries have
similar, less restrictive laws.

Taping and retransmitting amateur radio broadcasts may be cool
if the original broadcaster intended it to be public. Then again,
it could be copyrighted as well.

In the case of a murder trial, if no one gave their permission to tape the phone conversation, then a tape made off a scanner would appear to be in violation of the Communications Act of 1934.

For about a week I was monitoring a guy (somewhere in the 800MHz band :-))
who was cloning cell phones so that they would use other people's accounts. I
taped some of the conversations, and had an idea to the guy's location. I
called GTE and Cellular One and they didn't seem to care too much. I told
them this guy was running a big operation stealing phone service. I said I
wanted to remain anonymous. They kept asking me how I knew and if they could
take my name and have someone call me back. Yea, right. They eventually said
that they didn't have the resources to investigate this type of crime and that
the Secret Service did the investigations for this sort of thing (?). I spoke
to a SS guy in San Francisco and it was a dead end, so I dropped the issue.

Yes, indeed. My guess is that amateur transceivers would actually work *better* as amateur receivers if they only covered the amateur bands. This is particularly important if you are trying to operate an amateur radio station near a cellular phone site (perhaps they let you patch into their system during an emergency to temporarily restore a broken link). Not only can you build the radios with narrowband filters that keep out unwanted cellular phone signals, but synthesizer performance generally improves if you don't have to cover continuous wide frequency ranges.

Actually, some of the worse wideband receivers seem to have difficulty in high RF areas (near New York city, for instance) due to the broadband front ends. Breakthroughs in technology to eliminate this problem at low cost do not appear likely (its a problem manufacturers have known about for decades).

> the ARRL, non Hams need not apply.

The ARRL is an organization of hams, run by hams for hams. Of *course*
their policies are geared to representing hams. It would be foolish to
think otherwise. You might as well ask the NRA to represent people
who don't own guns, or the American Medical Association to represent
people who aren't physicians.

The ARRL was formed to represent hams. If you want an organization that
represents scanner owners, start one.

I think we'll do better persuading manufacturers to allow 850-MHz reception and not 868-896; and also not eliminating 902-928 MHz reception, than to take on the cellular lobby. C'mon guys, there are probably more cellular telephones in the US than there are hams in the world. One of the key factors in strategy is picking the battleground. No way could ARRL have defeated ECPA. We'd have wasted thousands of dollars and countless hours of staff time for nothing. For hams, the key issue is NOT the ECPA. If hams want the 850 and 902-928 coverage the manufacturers will give it to them.

The marketplace is a strong determinant. The cellular marketplace is obviously bigger than the scanner marketplace. If the amateur marketplace wants those frequencies in its equipment the smart manufacturer will provide them. Just because Kenwood has dropped such coverage from current models doesn't preclude their including them in future models.

Good listening,

Jim

John Krenz x6817 (krenz@nicmad.uucp) wrote:
: Could someone please explain why I would have to mod my new PRO-46 scanner
: to receive cellular. The spec's on the back of the unit say-

: Model# 20-305, Serial# 35071085, Freq Range: 29-54, 108-136.975, 137-174,
: 406-512, 806-956 MHZ.

Interesting, except for the serial number (naturally) and the last frequency range, mine is exactly the same. The difference in the last frequency range is that mine says:

806-823.9375, 851-868.9375, 896.1125-956

Perhaps yours covers this too, but the label simply says 806-956 for simplicity -- though it's kind of like false advertising.

I remember Metro talking about this when I lived in Houston. The plan was to
install a fiber cable system along the HOV lanes. They had future plans to
install cameras along the freeway for monitoring not only traffic conditions,

but also for disabled vehicles late at night to try and get them some help.

I would say the "antenna" you see is a lightning rod, and they are sending the video back via coax/fiber. They would also control the camera over the coax/fiber. The RF bandwidth required to bring back multiple video images, and control several cameras, would be difficult to license, especially in a metropolitan area like Houston.

4159. Scanners as home security

Newsgroup: rec.radio.scanner
Date: 1994-05-25 15:22:04 UTC
From: annabs@u.washington.edu
Message-ID: <2rvqes$8lv@news.u.washington.edu>
Source record: 273989

Here's a different spin on scanning.

I have had a scanner(s) for the past 10 years. I have found them to be an innovative home security device. It's simple. When I leave the house, I turn my scanner on so that it can be heard from outside either door. (Not blaring, but on loud enough so that it could be heard in a quiet house.) If a burglar approaches and hears the scanner, he probably will not try to break in based on that fact that 1) a police officer may be inside, 2) a police officer may live there, and/or 3) it may be part of a special security device that is linked into the police department.

I have discussed this with numerous police officers who all felt that it would certainly be a deterrent to most criminals who wouldn't want to take the risk.

>Iacocca said, "either lead, follow, or get out of the way."

Duane, I admire your resolve to act on the issue because I often feel the same way about a lot of different issues. My feeling is that we don't have a leg to stand on. How could we ever have any influence in government? We are minority group. We do not contribute any useful service or product to society. And, there is no constitutional right to scan the airwaves (although some may argue this point). So how can we have any influence? I don't mean to belittle the hobby, because I love it, we just don't have any source of bargaining power to have any influence in governent.

Imagine us trying to lobby some senator: we are not large enough to effect the election, we don't have any money to throw around, and we can't scream that our "rights" are being taken away.

In order to lobby successfully, you have to have some influence. The only influence I can imagine us having, is if we were very active at calling and writing congress, it might create the illusion that there were enough people to influence the next election.

I still think that the general public does not understand our hobby and we are better off just keeping quiet. We pose no danger, but the press can create the illusion of danger when they find out all the things we can listen to.

Harumph - like in this context Amateur Radio itself is any less
of a sacred cow? Hey - I LOVE this hobby of ham radio, otherwise I
wouldn't have stayed in it 20 years.

But I'm sick and tired of the IRRL (Imperial Radio Relay League)
looking at the hobby as some god-given gift that can protect itself.
IMHO, we need to get ACTIVE and we need to get active NOW before it is
too LATE.

The precedent of both the Electronic Communication Piracy Act
and the $^*%^&$%! scanner laws is clear for those who are willing to
see it......

To wit, that big money lobbies will roll right over your face
if you give them a chance and they don't give a DAMN about individuals.
And worse, the Congresscritters (given the lackluster opposition
mounted to the abuses) will kiss the butts of the monied minority
to get their slice of the spectrum pie cash-cow.

In general terms, that's nothing new. But to restrict,nay OUTLAW
access to the spectrum is, well, frightening and needs to be
stopped cold in its tracks.

>Sorry, nobody has convinced me that there's any reason for ARRL
>to work for repeal of ECPA or the scanner ban. You can rest

>represent Amateur Radio interests, as we have for over 75 years.
>With any luck, we'll also avoid sticking our noses where they
>don't belong.

>Why doesn't somebody start a national scanning organization to
>represent scanner owners?

This is a good idea. Maybe we *should* do that. And as an
organization, we'll REMEMBER that ARRL told us all essentially
to go and stuff ourselves, right?

WRONG.

I am thinking of that old statement by the Lutheran pastor,
Francis Niehmoller and his 1945 statement -

"When they came for the trade unionists, I did not speak out because
I was not a trade unionist.

When they came for the Jews, I did not speak out because I was not a Jew.

When they came for the Catholics, I did not speak out because I
was not a Catholic.

Then they came for me, no one spoke out because they had taken everyone else."

****

OK, granted, that pushes a lot of emotional buttons for people. But
I use it to illustrate a point - as a coalition of combined and related
hobbies, we are MUCH MUCH MUCH stronger and more effective than as
a number of smaller groups pissing in the wind about a narrower topic
that affects fewer people.

I am sorry to hear that ARRL doesn't realize this and/or won't accept it.
With the sort of crap that is wandering around in the halls of government
these days, ALL radio hobbyists are threatened and ALL of us need to
come together and support each other.

ARRL, being probably the *largest* of such groups of hobbyists, is
probably in the best position to take a leadership role and work with
other, smaller groups to come together into a larger, more effective
force.

That they evidently don't wish to do so is, IMHO, appalling.

"When they came to take 220 MHz, we did little because it was only
one band out of many.

When they came to shove the ECPA down eveyone else's throats, we did
nothing because it "didn't affect us".

When they banned scanners that could receive certain frequencies, we did
nothing because it "didn't affect us".

And when they came to shut down amateur radio and give all our spectrum
to commercial interests, no one spoke out because not only
did we not help them, but because all their rights were gone, too."

****

Nothing personal, Jim, because you seem like a level headed and clear thinking
kind of guy.

But you can take that last little ditty there in the quotes and take it
to ARRL HQ and tell them to put that in their pipes and smoke it, instead
of whatever it is that they ARE smoking......

As for the rest of us, *I* think it is time to start trying to pull
together other radio hobbyist organizations into a functional coalition.

If you are a member of such an organization, and have ANY kind of access to the officers of the group LOBBY them to do so. Write letters, make phone calls, send email if appropriate - whatever.

It is high time to fight back against spectrum losses and assaults on our rights......

ARRL can either join the fight or be left in the dust. Or as Lee Iacocca said, "either lead, follow, or get out of the way."

I have an old Uniden 100XL scanner. When it is turned on, I get static, but no display. Before I lost the instuction book, I recall that there was something in it about resetting the microprocessor by turning it on with a key combination or something.

Does anybody know how to do this? Please reply by e-mail.

Is anybody willing to fax me the instructions?

Thanks in advance.

JSG

Source record: 274005

The pro-46 does not cover straight through 806-956. I'd bet that
it was done like that to save space. If you open the manual though, it
has the same ranges blocked as the pro-43.
It IS however a very good scanner. It is almost as good as the
pro-43 except for no hyperscan(but the pro-46 is MORE sensitive) and
triple conversion. Besides, since it is disco, you can get it cheap.

|> .
|>
```

If this *is* a lightening rod, I wonder how effective it would be? Seeing as a bolt of lightning travels over larger distances than would seem to be present in this depiction. Wouldn't the energy from the bolt arc accross the span between the "rod" and the camera?

By the by, has anyone got any good information on protecting those outside discones from lightning? Arresters and grounding techneques?

>comes with a 90 degree BNC to PL259 adapter (which the antenna is built
>on).

>Overall good antenna...I'd buy another one if I needed it!

As I understand it, the MAX800 is a 1/4 wave groundplane designed
for 800/900 MHz. It is NOT a wide-band antenna. I've built my own
1/4 wave 800/900 MHz ground plane from an SO239 (UHF female panel
mount) connector and welding rod. Sucks in 800 and 900 MHz stuff
like crazy. Total cost (with coax): about $10.00.

The 1/4 wave ground plane (and many other antennas) can be found in
the book "Now Your Talking" available at Radio Shack. "Now your talking"
will provide you with everything you need to know to get your
no-code TECHNICIAN CLASS amateur radio licence. It also contains a
wealth of information (such as ground plane antenna design) even if
you are not interested in joining amateur radio.

Why not save a little money and learn something along the way??

Have fun.

> He said he owes me one. I'd say that's grateful.;)

I once had a neighbor who dealt drugs. What makes this a good story is that he was stupid enough to arrange drug deals using a *cordless* phone.

I taped a couple of these calls and brought the tape down to the local police station. I played it for the guy at the front desk, and he got real excited and made a phone call. A couple of detectives came out and listened to the tape, writing down some details like times, places, and phone numbers that were mentioned.

That night they were able to watch the entire drug deal and arrest the seller and the buyer. They not only called me to express their appreciation, but they showed their gratitude with a nice cash reward from the Crimestoppers program.

Most departments ('cept maybe little PoDunk SOs) use multi track
recorders that have a date/time stamp encoded on one track. "Most" also
have procedures that must be followed regarding changing of tapes and
appropriate record-keeping. Tough to hide stuff when you've got to
account for every minute.

4177. Pro-43

Newsgroup: rec.radio.scanner
Date: 1994-05-25 23:30:00 UTC
From: eric.jellison@windmill.com
Message-ID: <59.2377.4048.0N63B286@windmill.com>
Source record: 273930

I own a Realistic Pro-43. I am glad to read that I have a good scanner.
It picks up the following freqs.:

30-54 MHz
118-174 MHz
220-512 MHz
806-823.9375 MHz
851-868.9375 MHz
896-999.9875 MHz

Are there any modifications that can be made so that it can pick up more
freqs., and if so what do I do, and what freqs. will it give me.
Thanks

>about it if anyone has ever been able to help the police thanks to some-
>thing they heard while scanning.

This isn't my story, but it happened while I was listening one night. There was a serious car accident in a rural area west of Portland. Fire and county sheriff were on the scene and Life Flight was activated. The accident scene was on the far side of a hill and there was patchy fog in the area, so the chopper was having a real hard time finding the scene. The chopper was on Fire's freq trying to get directions, but the fireman couldn't see over the trees or past the hill enough to see the light on chopper.

Then the Fire dispatcher comes on and says there is a scanner listener who has been following the situation, can see the chopper, and knows the area of the accident scene. "The person with the scanner says the scene is due West of your current location about three miles." After a little more assisted navigation, they found the scene. The fire dispatcher sounded a little skeptical at first, but everyone sounded appreciative once the scene was located.

>-Layne

Yes, there are many holes in the 46, but if you look in
kilroy.jpl.nasa.gov /pub/hamradio/Mods ; there is the
pro46.mod that will get rid of those holes.
Goodluck, I got one and did the mod.

There is a local BBS in the area dedicated to local scanner users. It's called ODDX and it's number is 930-9563. There are several public files on the board with lots of freqs (from military to PSB). Just post a general message to all and ask for help or info if you need it.

Just curious but where are you stationed now and what is your specialty ?

I am trying very hard not to start a flame about *authoritative*
pronouncements when the poster has not does his/her homework.
Please read the act and/or post the specific language to which
you refer. :-) :-) :-)

> Taping and retransmitting amateur radio broadcasts may be cool
> if the original broadcaster intended it to be public. Then again,
> it could be copyrighted as well.

Section 705 Communications Act of 1934, regarding the
prohibition on divulging radio transmissions, states, "This
section shall not apply to the receiving, divulging,
publishing, or utilizing the contents of any radio
communication . . . which is transmitted by an amateur radio
station or by a citizens band radio operator . . ." Sorry I
don't have time to correct the other errors. It's a busy
week. Maybe this weekend.

4182. Retransmission can of worms

So Brad, this brings up an interesting question--must I turn off my scanner every time my phone rings? Am I retransmitting commercial broadcast signals illegally if my mother can hear my TV in the background when she calls me? If I don't turn my car radio down before I talk on the CB can the record companies come after me for rebroadcasting their copyrighted music?

Im sick and tired of my BC 760XLT. Its junk! Besides this I want a hand held, and short wave. I used to think the AOR1500 would be a dream come true. I need this range of freq's, with SPEED! The police in my area have gone to a 800Mhz truncked system, so speed helps in this situation. My Price Range is $400 to $700. Please let me know what to get and why. I will sum. and post results if there is enough interest.

Thanks

If the statute really says "personal gain," I don't see how informing the
police about a crime or the whereabouts of a criminal could be illegal. I
doubt that would be "personal gain."

Cross-posted to: rec.radio.shortwave,rec.radio.amateur.msc,rec.radio.scanner,rec.radio.cb,alt.radio.scanner,alt.radio.pirate

COMMON INFO

Dear Sir or Madam,

The purpose of this letter is to present Radio Moscow
International - the radio broadcasting company "Voice of Russia".

Radio Moscow International is one of the world's largest radio
broadcasting corporations.

Radio Moscow International has now been broadcasting to all parts
of the globe for almost 65 years. Listeners all over the world have
become used to its programmes during these years. Broadcasting is
carried out from our studios located in the heart of Moscow, in
Pyatnitskaya Street, to the countries of Europe, Asia and Africa, the
Middle East, North, Central and South America, Australia and Japan.

OUR AUDIENCE EXCEEDS 100 MILLION PEOPLE!

Prominent politicians, businessmen, bankers, people from culture
and the arts are invited to take part in the programmes of Radio Moscow
International. An analysis of listeners' letters shows that almost
every business proposal, included in these programmes, finds an
addressee and is usually successfully implemented.

WE OFFER YOU A UNIQUE OPPORTUNITY!

The World Service is a "Bureau for Classified Ads".

Today anyone can utilize our airwaves for giving information or
for advertising - and which will be heard throughout the whole world.

The commercial department of Radio Moscow International offers a
complete service - to produce a commercial about your product or
services and broadcast it in our programmes.
A one minute commercial broadcast by Radio Moscow International
costs between 140 and 250 US dollars, dependent upon the time of the
broadcast. You will find no better value anywhere!

ATTENTION: Production of Video and Audio Clips!

The Commercial Department can ensure for you:

* The production of video clips, logos, running lines and
videofilms by way of computer drawing, re-recording.
* The production of audio clips in any language.
* The placing of commercials in all TV and radio programmes at the

prime time and beaming to all CIS regions.
* Preparation and broadcasting of commercial interviews in the important reports or full-length TV and radio programmes and ads of individuals in the Russian and international wavelengths.
* The sale of segments of air time to broadcast to any region of the world.
* Live or pre-recorded air-links at the client's request.
* Leasing studios for the production and cutting of video films (BETACAM SP.), leasing professional video-cameras (BETACAM SP.).
* Provision on a contract basis of radio frequencies (short and medium waves) for a client's individual programmes; leasing a studio complex; leasing satellite communication channels; the sale of a TV communication channel.

 OUR AIM IS FOR A HIGH QUALITY AND RAPID FULFILMENT OF ORDERS
FOR VERY REALISTIC PRICES.

If I were to do such a thing, I would clip the wire at its bend with a small
pair of wire cutters. I'll bet a strong pair of fingernail clippers would
have worked for me, and the whole job would have taken about 2 minutes--if
I had actually done this to my 2006. Completely sever the wire and separate
the two ends slightly.

I recently purchased a Uniden scanner, model 70XLT. I would like to increase it's reception range so that it would include 800MHz and above. Is this modification possible on this particular model? If it is, would anyone mind sharing exactly how to do it? Thanks.--

There is advertisement in J.C. Whitney catalog stating that they sell a converter for booth hand held and base stations that 'Expand the range of scanner radio' to include the 800 mhz frequency.' It goes for $85 to $90. Also, they sell a scanner radio preamp it boost signal reception up to 20db. This sell for $55 to $65.
I don't know much about scanner so any and all info would be helpful.
Thanks, John

>: I often see what appear to be two cellular phone antennas on vehicles. Do some
>: cellular phones have diversity receivers, or do these folks just have two phones in
their cars?

Many times it is only one cell phone, the other antenna that looks like a
cell antenna is normally for an 800 Mhz system of some sorts... It uses the
curly antenna like cellular because of the gain at the short wavelength.

> Why do some police squad cars here in the Dallas area have three antenas mounted
> on the rear deck (or roof) in a triangle? Is this the MDT system?

The antennas on the rear deck are for a doppler dfing system. They tell the
direction of a signal and how far away it is. I assume that they calibrate
the distance finder to each individual radio system as it would be a
function of how much power each radio is running...

Most cell phones are not two line capable. The OKI 9xx is multi-line
capable and can do things such as conferencing. Most cell phones also
cannot switch NAMs (service providers) which is important if you work
(drive) into and out of different service providers areas. Consequently,
lots of folks, especially in the construction industry have more than
one cell phone in their vehicles. My brother-in-law has three.

My BC760xlt has an IF of 10.85 Mhz, so try -21.7 Mhz. I have had other
weird images appear on my '760. Seems that the Feds put up a 5 channel
trunk system (I think it is at NASA Lewis) one of the freqs (407.95 or
407.15)has its image appear on top of one of the local PDs on
460.025 - I have no idea how that worked out! I solved the problem by
programming the PD in at +21.7 (481.725) - no fed image - just hear the
PD as I want it!

|Overall good antenna...I'd buy another one if I needed it!

Don't forget the Rat Shack UHF double-bow-tie indoor antenna; simply turn the unit on it's side so as to optimally receive vertically polarized signals, feed the 300-ohm impediance twinlead into a CATV-type 300-to-75 ohm transformer and the output into the antenna input of the scanner.

You get plenty of antenna gain and directionality; of course, you'll want to add an appropriate stand for the antenna. Works beautifully in suburban areas that are a bit aways from those cell sites... (of course, your neighbors might get suspicious of that sidemounted UHF antenna in the picture window pointed in the direction of that cell site... :-()

Motorola came out with phones that had a port for another receive antenna. If the antennas are mounted far enough apart, and not an a wavelength multiple distance (ideally you want the other antenna to be 180 deg out of phase) then the reception was improved.

However, this model came out when cellular was young and there were lots of areas with shadowing and fading. Today there are cell sites just about everywhere, especially in Southern California. The chances of dropping a call due to fading have decreased quite a bit in the past couple of years.

Just my 2 cents worth (.3 cents after Hilary's health care plan kicks in),

If they were, the antennas would be much larger than "cell phone" antennas since Lojack is around 170 MHz.

My guess is that one is for the MDT, one is for the 800MHz trunked police radio and one is for his cell phone.

As a single-point hobby (scanning/monitoring) that's true. As
a coalition of groups working for the same goals, we'd stand a much
better chance.

>Imagine us trying to lobby some senator: we are not large enough to effect
>the election, we don't have any money to throw around, and we can't scream
>that our "rights" are being taken away.
>In order to lobby successfully, you have to have some influence. The only

>I still think that the general public does not understand our hobby and we are
>better off just keeping quiet. We pose no danger, but the press can create
>the illusion of danger when they find out all the things we can listen to.

"Keeping quiet" is what those who are responsible for the
outrageous laws WANT you to do. To just let it quietly go away suits
their ambitions nicely.

You need to look at the broader picture - these kinds of laws,
not just specifically the ECPA or the scanner ban, are precedent setters
with rather broad long-term implications.

Specifically, the notion that a big money lobby should be able to
just come and take away a segment of the electromagnetic spectrum for
their own purposes (in the case of cell phones, for the cellular
industry to cover up their lies. What lies? They told their customers
that cell phones were secure when they WEREN'T, and then went out and
BOUGHT congresscritters with lobby money to cover their asses).

If you "keep quiet", yes, you'll be OK for now, but WATCH OUT.

Who will be the next big lobby to come along and demand that
it become illegal to listen to X frequency band?

How long will it be before you won't be able to listen to
ANYTHING?

Every big business that decides it wants to keep its operations
as some kind of big secret NOW (thanks to the precedent of the
Electronic Communications Piracy Act) no longer has to worry about
encryption costs (which was a relatively bogus argument used by the
cellular industry, that encryption would be too expensive of a way to
secure their tranmissions) and can just throw enough money around in
the right places and will quite likely succeed in getting THEIR
bit of spectrum added to the "thou shalt not listen" list.

You ask why aren't cordless phones included? Go look at what
is happening in several states. These *states* are passing laws to
make it illegal to listen to cordless phones. IMHO, that is
unconstitutional (or at the very least, violates the entire basis
of having a FEDERAL Communications Commission) as the FCC has
reserved control of communications to itself.

If we as individuals don't stop bickering about "our group
isn't interested in this or that", all the time we spend engaged in this
bickering will be lost to accomplishing the major goal, that of
protecting *individual* access to the electromagnetic spectrum.

As for "rights", consider this: the electromagnetic spectrum is
part of *nature*. Mankind did NOT create it any more than we created
the air we breathe. That we *manipulate* the spectrum for our own purposes
IS true. Controlling who TRANSMITS and WHERE is primarily done
to avoid the anarchy that happened in the early days of radio.

But IMHO, if someones radio waves penetrate my home, my body,
and so on, why should I not be able to LISTEN to them?

Secondly, check out Section 605 of the Communications Act of
1934. In brief, it states that no person who receives ANY radio signal
may divulge the contents of that signal save for broadcasts intended for
the public, Amateur Radio signals and signals related to ships and planes
in distress.

That should have been enough! While still allowing individual
access to LISTEN to the spectrum (a naturally occurring phenomena), it
prohibited divulging the INFORMATION (the strictly manmade part)
which is a result or our manipulation of radio waves.

If the intent of the ECPA was to secure the information, then
simple enforcement of Sec. 605 should have been enough; no further
legislation was needed.

But because of the far-reaching implications of the ECPA and the
Scanner Ban, it seems obvious that something more is intended, namely
allowing economic interests to control the spectrum and saying
that the individual is screwed. To bolster that argument, I point out
the crazy notion of "spectrum auctions" that the FCC is currently
engaging in. Spectrum Auctions will allow commercial groups to essentially

buy chunks of spectrum for their own use. When that happens, do you think that a commercial interest will want to let you listen to chunks of spectrum that they "BOUGHT" ??? Hell no, not when they have the precedent of the ECPA to fall back upon.

In both Nazi Germany and Stalinist USSR, access to the spectrum was strictly controlled by the government to keep out "harmful" ideas. Individuals found in posession of "contraband radios" could be, and were, taken out and shot. The control of information is a powerful thing, and it strikes me that here in the US, we are seeing an attempt to do so NOT by the government, but by big business with the tacit assistance of the PEOPLE WHO ARE SUPPOSED TO REPRESENT *ALL* OF US.

Big business already has control of radio and television broadcast content - if you think you get a truly balanced picture of world news from CBS, NBC, ABC, etc., I suggest you get yourself a decent shortwave radio (before they ban THOSE, too) and listen to what some sources from other parts of the world have to say. You may not hear the WHOLE truth from ANY of them, but you might be surprised how much of a "slant" that the US media puts on things.

Fighting to keep the spectrum reasonably free isn't JUST a ham thing, it isn't JUST a scanner thing, it isn't just a SWL thing. It is important for ALL of us, and if we don't work together to do it, we WILL lose, and our lives will be the worse for it.

I have been having trouble posting messages and so I hope this makes it. Yesterday I talked to the officer in charge and he tells me that these guys were career criminals and that this is going to be a third strike case. I have been subpoenad(sp?). Will I testify? Faster than a black hole sucks stars.

On Monday, January 24, 1994, with my radio scanner to my right, set on San Jose Police channel 1, I was reading and as usual not really listening to what was being said on the scanner. But then I heard something about a house break-in in progress one block across and over from my street. Two guys who were trying to break into the house didn't realize that somebody was home at the residence. I debated whether I should go over there and do something. Scott, who had just turned four year old, was with me and decided to stay home. About five minutes later police cars started arriving on the scene and scanner messages saying the burglars were fleeing the scene, jumping fences and abandoning what turned out to be a stolen car. An area of several blocks in each direction was soon surrounded by police cars. A house-to-house search was begun in the area where the police thought the guys were most likely hiding. The search didn't cover the small part of our L-shaped street. The search did cover the long part of the L and other streets concerned. The police abandoned the search about 1:00 pm and left the area. This concerned me because I knew the elementary school was going to be letting out at 2:15 and a considerable area hadn't been checked. I must of checked my back yard about 15 times.

At about 1:45 Scott and I left home and as usual we walked to the school to pick up Jack who was age 6. While waiting for school to let out, Diana walked up to me. I had forgotten that she was going to pick up Jack that day to take him to the doctor. Diane wanted Jack to change before going to the doctor so we all went home together in the car. After entering the house I went to check the back yard, first on the chimney side- found nothing- then the garage side.

There was what I knew immediately must have been one of the suspects. He was looking out a knot-hole in my gate. I continued to walk toward him as I didn't see any weapons in his hands although my pitch fork, English spading fork, a pick, and several other potentially lethal garden tools were about 5 feet to his right. I asked him in a friendly voice what was going on. He turned around and was very startled to see me. He stated that he was hiding because the police were looking for him. I continued walking toward him and it didn't appear that he was going to flee. I told him that I thought it was

safe to go because there weren't any police around. By this time I had reached the gate with him just to my left. As I reached for the gate latch I remember thinking to myself that I could open the gate and let him go or try and take him down. I did the latter.

A cloths line across his neck with every once of my strength, I slammed him across my side down to the ground. I held him there face down, in an awkward position, with my knees on his upper back, my left arm across the back of his neck, and my right hand by his jaw. I could hear Diana come out the front door with Jack so I yelled to her that I had one of the guys on the ground and to go next door to call police. The suspect kept asking to let him move his arm and told him he hadn't better move a muscle. I could see that pick 5 feet in front of his face. I could hear Jack, he was hysterical. That really upset me and at that point I wanted to snap the guys neck. Well it seemed like it took forever for the police to get there. One of the policeman handcuffed him while he was still on the ground. My muscles were literally shaking from holding him in that awkward position. And the police had to help me up because I was virtually stuck in that position, because of having psoriatic arthritis in almost every joint of my body. They asked if I needed an ambulance to which I said no that I would be fine in a few minutes.

The police put the suspect in the police car, and then started questioning me. One of the questions was how I knew what was going on. And I told them that I had a scanner. Jack was still crying and several of the policeman said to Jack "you should be proud of your dad, he's a hero". Jack immediately stopped crying and his face lit up and I was feeling a bit proud.

>hear, no matter what freq. you hear it on...

There is a story in the current Monitoring Times magazine exactly like
you describe (on cordless though), but the officers made the bust.
Even though they caught them red handed with the drugs, the judge
threw out the case. Federal law states that one has the right to privacy
in ones home, even if transmitting on "legal receivable" cordless.
That use of such information by law enforcement would be approaching
a totalitarian state (AKA Orsen Wells "big brother" syndrome).

On a case by case basis, the judge seems wrong, but in order to protect
the privacy of all individuals, he was right.

If he didn't rule this way, how far could the cops go? parabolic
listening devices on the home? The possibililties for abuse are huge.

I'm not inferring that cops are bad, but the law is made to prevent
any possible corruption of government from effecting the freedom
and rights of the public. Thats why we have elections, and the
right to bear arms, etc...

The best and most easily modified scanner available is the Radio Shack PRO-2006. This scanner can be modified by removing the top cover and clipping one leg of a diode that resides on the back of the keyboard matrix. Books that describe this modification can be found at any ham radio store.

>radio and one is for his cell phone.

We have the same thing on many departments' vehicles out here. From listening to the scanner, I am guessing they are part of a new locator system used in finding bank robbers. Out here, the cars with the special antennas are nicknamed "Yankee" cars. Every so often, I will hear something like "All Yankee cars report to Net 5." On net 5, I hear dispatchers calling the status of some apparently stationary antennas ("Citywide is hot. North tower just went hot. Downtown is going cold.") Then the cruisers call in reports like "(location) I have 5 lights, due south," or, "(location) 2-3 lights east-northeast." I know it is bank related because one morning (about bank opening time), the city police chased down a transmitter right to the bank. One of them said something about a teller accidently tripping the "tag".

Some of this is assumption. I have never been behind a car with the three antennas and hear his radio traffic identifying him as a Yankee unit.

Anyone know anything more about these "tags" and "Yankee" cars? Have you heard any of this kind of traffic on police frequencies in your area?

I / many of us never had the opportunity to do much about it, it was tagged on the funding bill for the FCC and railroaded through with NO JUSTICE at all. When I / many heard about it, it was too late. The best we can do is continue to import them from Canada and Europe, stick out our middle finger at the FCC, and boycott the made-for-U.S. receivers until the U.S. based manaufacturers do something about the government action (it seems they must show a loss of profit to see a need to do something about it).

There are numerous places overseas that these units can be shipped in from. It just costs more. You can still have a cellular capable receiver here in two-three days from the U.K and overnight from Canada!

Opto Electronics already has designed an add-on for the Pro-2005/6 which will over-ride the blocked CPUs to permit cellular reception. If they canned the FCC, there would not be a need for "funding" them, and this stupid law would not cause us to go out of the country to equip ourselves with full coverage receivers.

In any event, the ARRL was asleep on the job. I always thought that stood for Amateur Radio Relay League. I always thought that Amateurs had an interest in all aspects of radio equipment including all such activity, not only on the segments they are permitted to respond on!

In any event, all they did was make us go out of the country for our radios, they certainly did not stop them being obtained!

If you wonder, what side of the fence is this guy standing, try reading the bottom right of this post, I think those three lines say it all!

We're experimenting with providing free public-access to our Informix database of FCC license information for radio transmitters located in California. The information should be accurate as of 09/30/93. More than 300,000 records are on file. Microwave, satellite, broadcast, and cellular records are included as well as business and public safety.

Telnet to: tcomeng.com
Login: fcc (no password)

VT-100 terminal terminal emulation is required. If there is enough interest, we will enhance the query interface and support other terminal types. You will need to carefully read the introduction in order to successfully use the database.

This service is provided in the public interest by Telecommunications Engineering Associates of South San Francisco, California. Send comments to fcc@tcomeng.com.

wb9omc@constellation.ecn.purdue.edu (Duane P Mantick) writes:
:
: Every big business that decides it wants to keep its operations
: as some kind of big secret NOW (thanks to the precedent of the
: Electronic Communications Piracy Act) no longer has to worry about
: encryption costs (which was a relatively bogus argument used by the
: cellular industry, that encryption would be too expensive of a way to
: secure their tranmissions) and can just throw enough money around in
: the right places and will quite likely succeed in getting THEIR
: bit of spectrum added to the "thou shalt not listen" list.

This is wrong. Any business with any sense still has to consider
encryption. They would be aware that, even though such listening is
illegal, people will do so anyway. Now, if hobbiest will do so, how
about those who make a living at industrial espionage? You can bet
that a minor "thou shalt not listen" law is not going to slow them
down at all.

: You ask why aren't cordless phones included? Go look at what
: is happening in several states. These *states* are passing laws to
: make it illegal to listen to cordless phones. IMHO, that is
: unconstitutional (or at the very least, violates the entire basis
: of having a FEDERAL Communications Commission) as the FCC has
: reserved control of communications to itself.

I suspect that when these laws are contested in court, they will be
thrown out. After all, the US Supreme Court has already ruled on this
matter.

Hey now,
does anyone know what are on these channels that the Pro-43 doesn't cover:

54-118
175-219
513-805
824-850

Aren't the cellular bands above 850, like 868-890, or somewhere in there?
Perhaps these are commercial bands, private or something like that?

Thanx for any help...jeff

Isn't it always the case that when you've finally decided to part company with a large chunk of cash on a particular model, that two weeks later the same manufacturer release the 'new' model onto the market with all the features you really wanted in the last one but were missing.

Well - as the Yupiteru 7100 is on my future shopping list - does any informed person out there know whether the 7200 Turbo GTi or whatever the next one might be called is about to hit the market. I suspect it's about time a new model appeared - although the current 7100 seems just about complete...

From: C594911@mizzou1.missouri.edu
Message-ID: <16FC322C6S86.C594911@mizzou1.missouri.edu>
Source record: 273913

Frequency Counters are fun! They measure (radio) frequencies. They can be used with a probe-tool to analyze circuits, etc, but their use for us is that they catch a frequency when a nearby radio is transmitting. The catch is "nearby". I find that with most personal radios (police, handhelds, etc - not radio stations, etc) you have to be within at least 100' if not closer to get a solid reading.

I have mine velcro-mounted in my car with an external antenna, along with scanner, ham ht, etc. When I'm driving around I can tell when someone is xmitting near me. A cop passes me and the display might jump from the random jumble and "lock" on some 450Mhz frequency. Cellular freqs for the driver next to you while he's talking, unknown weird antennas protruding from unmarked buildings, etc. I bought mine in response to FEMA and the MoEMA's refusal to give me their freq's while I sandbagged the flood in St Louis last year.
All I had to do was linger nearby and I quickly got them... :)

The frequency could be anything at all. It depends on whether they are trunked radios, conventional, UHF, VHF, 800MHz, 900MHz. We make all sorts of radios with all sorts of frequencies.

The FCC was not pushing this bill, so don't blame them. The cellular lobby is
very powerful. They pushed congress to do it and the FCC had no say in the
matter. CONgress is to blame here (together with the cellular industry).

You can probably assume that they use business band frequencies. Since you know they use Moto radios, you can probably determine what band they are using by looking at the antenna lenght and shape. If you post this info, I'm sure someone can help you determine which band they use.

4236. Has Grove sold out to the FCC?

Newsgroup: rec.radio.scanner
Date: 1994-05-27 08:50:28 UTC
From: tim@tbd.oau.org
Message-ID: <URb5tA4EBh107h@tbd.oau.org>
Source record: 273911

I never thought I'd see the day it would happen, but Grove Enterprises seems to have either sold out to the FCC or grown to the point they no longer care about the monitoring community as a whole, only their own self interests. For several months now Monitoring Times has been publishing misleading and downright false information about obtaining full coverage scanners after April 26. It's been so bad that many of the guys on Compuserve now openly question information from Grove and MT. This is very disturbing as MT used to be a very accurate and highly regarded publication in the radio community. I personally still find MT a very accurate and informative magazine. Hell, my subscription would not run until August of 1998 if that weren't the case, however, there is one big exception to the accuracy of MT.

In the June issue, page 115, we find a Grove ad for the PRO-2006 with a bunch of hype about "they're almost gone". The usual misleading drivel about how it's illegal to import and manufacture full 800MHz coverage receivers also appears in this ad. Then, Grove has the nerve to actually state "the only way to buy one of these scanners is from stock imported BEFORE [their emphasis] April 26, 1994." As we all know from other posts in this newsgroup this is outright bullshit.

In this same issue, page 11, an advertisement appears from Atlantic Ham Radio Ltd. in Canada that clearly states "we have scanners with 800MHz coverage" and that "all U.S. orders shipped UPS air." Yes, our beloved Yupiteru MVT-7100 is among the list of scanners Atlantic Ham Radio Ltd. will import to individuals in the United States. Even in their own magazine we find evidence that Grove's position on importing full coverage scanners is full of it!

Now the question is, has Grove sold out to the FCC or are they spreading lies because THEY cannot stock and sell full coverage scanners after April 26? Instead of printing BS about how U.S. citizens cannot import full coverage scanners into the U.S., why aren't they doing like Optoelectronics and developing hardware that furthers our hobby? Optoelectronics, if you haven't heard, has a computer interface for the new "cellular unrestorable" PRO-2006 that will provide full 800MHz coverage to the crippled scanner.

It's disturbing that Grove has taken this obviously erroneous position on the importation of full coverage receivers particularly given their past reputation of standing up to the FCC and advancing our hobby. BTW, Grove Enterprises does have an internet address for mail. It's 'grove@rock.concert.net'.

A CB antenna will probably work fine for most frequencies. Don't expect to pull in weak signals with it, but for around town, it will work fine. I'm note sure I understand your implementation, but don't hook the Scanner and the CB to the same antenna at the same time! If you transmit like this, you will probably blow the front end of your scanner.

The tags are small radio transmitters that the tellers try to throw into the
money bag they give to the bank robber. I have heard their frequency is in
the 170MHz range.

FYI, another trick the banks use is to throw a dye pack into the bag so the
money gets dye all over it. This way the money can be tracked/traced as
stolen money.

>Also, they sell a scanner radio preamp it boost signal reception up to 20db.
>This sell for $55 to $65.
>I don't know much about scanner so any and all info would be helpful.
>Thanks, John

The converters attach to the antenna input of your scanner. They are block converters. They essentially cut 400 MHz off the carrier frequency so if you want to tune to 861.2375, you would tune your scanner to 461.2375. Many years ago I had one made by GRE and it worked very well. The main problem is that if you are searching the 800 MHz band, a strong 400 MHz signal will also appear.

I would not reccomend a signal booster to anyone unless they live in a rural area. In most cases, these just overload the scanner front end and decrease the sensitivity of the scanner.

If you are looking for a handheld, check out the BC 2500XLT. It's 30KHz
spacing and 100 steps per second search speed make it ideal for searching
through the band. The cell mod is not difficult but it is a little delicate.

4241. Oakland ham area Index files

Newsgroup: rec.radio.scanner
Date: 1994-05-27 11:47:58 UTC
From: wy1z@bach.coe.neu.edu
Message-ID: <WY1Z.94May27074801@bach.coe.neu.edu>
Source record: 273882
Cross-posted to: rec.radio.amateur.misc,alt.radio.scanner,rec.radio.scanner,rec.radio.shortwave

I have created a new type of Index file for the oak.oakland.edu:/pub/hamradio
FTP area.

The new index file is named 0-Index2.txt, and is in the format of:

/directory_path/name_of_file, file description

which is great if you want to perform a grep of a particular program.
The result will be an instant directory path to retrieve the file from.

The other index file isn't going anywhere. It's format is still:

/directory_path:
names of files Brief description of file

The final index file, which is more confusing, but will continue to exist,
is the vanilla recursive subdirectory listing, ls-lR.

Brett, I have had the same problem with the headphone jack on my 3000. I found out that when the plug in all the way in you only get stereo on one side, but if you pull it out just a little it seems to work fine. I pump my audio into a switch box for the external speaker, tape, and FM transmitter so it is rarely that I use the headphone jack. As a result it doesn't effect me much.

I just had the whole scanner apart on the the work bench yesterday to find a way to tap into the 45Mhz IF and didn't even think to look at why the jack wasn't working correctly. I figured I could pull the IF to one of the spare pins on the DIN and use it in the future...

Although the Yupi does have shortwave, if you really want to scan trunked
800 MHz stuff, be aware that the Yupi has a MINIMUM delay of two seconds
so unless you want to keep your finger on the up/down arrow button and
hit it every time a transmission stops, get something else. If you can
live with the delay *feature* then the Yupi is by far the best handheld
I could recommend.

Out of curiosity, has anyone out there used a CB antenna (in this instance, my K40) as a radio antenna? I never thought about it until I discovered my power antenna didn't work and since the radio is already out, I can easily splice in the splitter.

Scanner-philes,

I like to take my portable (PRO-43) to Disney World in the summer and was wondering:

- Are there any laws/regulations as far as carrying the unit onto the aircraft ?

- What do you do when you approach the security/X-ray area before you get to the gate ?

- Any restrictions from the airline as far as turning on the scanner on-board during flight ?

Any info/advice is greatly appreciated. Thanks in advance.

Okay, Wayne, so you're going to get off your duff and join
the League, eh? Get active, straighten us out.

Time to put your money where your mouth is.

Not meaning to pick on Jim here but I have heard it said in previous messages, by others in the ARRL and other HAMS that to make a difference or to change the organization you need to 'join' or more exactly 'put your money where your mouth is'. Now sure the ARRL will gladly take your money and put it to good use forwarding their agenda which is to put forth and support HAM related issues. Why would any non-HAM want to join an organization that has all but said we are not interested in your issues because our charter says so? What would be better is for the ARRL to unilaterly welcome ALL radio users, HAMS and non-HAMS. Until such time any non-HAM joining the ARRL, with the hopes of changing the ARRL, is throwing their money away.

If the antenna is about the same width all the way up (or even taper all the way up), it is likely in the VHF range. If the antenna tapers and gets thinner about 3 inches from the top, it's probably a 800Mhz unit. Hope that narrows your search down a little. Look first on the itinerate business freqs.

>sharing exactly how to do it? Thanks.--

No. I have never seen a scanner that does not come with 800MHz that can be
mod'ed to restore this range. The radio lacks the RF circuitry to receive
this range. Most mods are in the "digital" section not the RF section.

: Scanner-philes,
: I like to take my portable (PRO-43) to Disney World in the summer and was
: wondering:
: Are there any laws/regulations as far as carrying the unit onto the aircraft?

None that I know of. I certainly would not put it in my checked luggage!
Besides the rough treatment that it could get, there are many incidents of
personel opening up and stealing from luggage.

: What do you do when you approach the security/X-ray area before you get to
: the gate?

With ANY electronic equipment - get a visual inspection! Be sure you have
fully charged batteries, as a visual will require it to be turned on.
Many electronic items now use microprocessors and often have permanent
code on EPROM chips. Besides being erasable by exposure to UV light,
an EPROM could become erased (it only takes ONE BIT!) from X-rays.

By the way, I include many cameras in this catagory. Besides being
electronic, there is a concern about the film. Most airport security
personel are told that any film under 400 ISO can go through the X-rays.
HOWEVER, X-rays are accumulative, just like the exposure of film to
visible light. Four passes through the X-rays with 100 ISO film is the
same as one pass with 400 ISO!

: Any restrictions from the airline as far as turning on the scanner on-board
: during flight?

Mostly, it depends on the airline. Some do not allow "any electronic"
equipment to be used on board, some only on take-off and landing. Some
leave it up to the crew to decide. The problems started occurring with
laptop computers, but the possibility of scanners, camcorders, and other
stuff do exist. Basically, most of today's aircraft rely on electric
signals, but were not designed to take into account any electro-magnetic
interference from within the craft. Complete navagation system failures
have been reported and cases where a passenger using a laptop turning off
the device after being asked resulting in the restoration of the navagation
system have been reported.

If I remember correctly, from an episode of 20/20, the Treasury cops were in
on this type of crime. They were flying around in a chopper somewhere in NY
scoping out signals from various dare I say it LOW RENT neighbourhoods. Ones
in which you would not expect to find too much cellular use which were
eminating lots of cell calls to latin America. Surprised me to see treasury
dept in on this kind of action.

I have travelled extensively with my Pro-43.

The security folks will not have a problem with your scanner although they may ask you to turn it on to be sure it is not some explosive device (they've never asked me to turn mine on).

The only time I have a problem with security is when my carry-on bag includes my Pro-43, Sony 2010 (shortwave), and my scuba regulator. Can you imagine what that x-ray must look like?!?

As for when you are on the plane, most airlines (and I think the FAA regs) prohibit the use of radios on board commercial aircraft (with the exception of those being used in the cockpit).

Some airlines (United) will let you listen in to air traffic control on the plane's audio system (usually channel 9). However, I find that I need to make a trip to the cockpit before takeoff to ask the pilots if they will turn it on. Some will do it and some won't.

Recently on a trip to Taiwan, I asked if I could use my scanner in flight. On the way to Taiwan the pilot said that it was against FAA regs. On the way home the pilot said "sure, go ahead."

My advice - it is your safety too. Leave the scanner off during flight but enjoy it when you reach your destination.

Delta specifically allows the use of "VHF Scanners" on their flights as long as it's not in the takeoff or landing phase. If in doubt, look in their "Sky" magazine under the information section toward the back.

Source record: 273919

Hi,

I am going to be in San Diego in the early part of June. I am looking for some basic frequencies (i.e. police, fire, etc). Also, is there any local rules/regulations I should know about?

Thanks

George Joos
gjoos@turman.nsc.com

I agree with Bill. I have both a Pro43 and 2006. Don't sell them short!

J>I'm having a hard time knowing how to refer to someone who listens
>to scanners. What do we call ourselves? Here's a few I've thought
>of, but none seem to really fit right to me:

J> Scanner listener
> Scanner
> Scannerer
> Scanner enthousiast
> Scanman (Scanwoman, Scanperson, whatever)
> Scannerman, etc.
> Scannerator

J>Any suggestions?

Well, we used to sarcastically call them "scanner fans". But I would
recommend one of the following:

Monitor
Monitorer
Monitoring Enthusiast
Communications Enthusiast
Communications Monitorer
Communications Monitor
An average American

Source record: 273839

M>I'll be going to Petersburg,Va. soon, does anyone have a frequency listing
>for the following areas?: Petersburg, Chesterfield County,Colonial
>Heights, Hopewell and any other place receptive to the Petersburg-Ettrick
>area, thanks.-PJB

I would have sent these E-mail, but no address was found on the message.

453.750 - Richmond Fire F1
453.650 - Richmond Fire F3
46.46 - Chesterfield Fire F1 (old lowband)
46.34 - Chesterfield Fire F2 (old lowband)
460.525 - Petersburg Fire F1
460.600 - Petersburg Fire F2
460.475 - Petersburg Fire F3
154.190 - Petersburg Fire (old VHF-Hi)
154.325 - Colonial Heights Fire
154.340 - Henrico County Fire
154.430 - Henrico County Fire
154.130 - Richmond Rescue Squads?
155.265 - Chesterfield Rescue Squads
154.160 - Chesterfield Fire paging/800 MHz repeater

Chesterfield County operates an 800 MHz trunked system. This system
includes Fire, Police, Sheriff, Parks, Utilities, Administration and
Courts. It operates on the following frequencies:

856.2125 811.2125
856.2375 811.2375
857.2125 812.2125
857.2375 812.2375
858.2125 813.2125
858.2375 813.2375
859.2125 814.2125
859.2375 814.2375
860.2125 815.2125
860.2375 815.2375

I also have a Virginia area Police Call if you want me to check that.

4276. Re: Carrying portable scanner onto commerical aircraft

Newsgroup: rec.radio.scanner
Date: 1994-05-27 20:51:49 UTC
From: el124@cleveland.Freenet.Edu
Message-ID: <2s5mh5$6fr@usenet.INS.CWRU.Edu>
Source record: 273855

In a previous article, compedge1@aol.com (CompEdge1) says:

>As for when you are on the plane, most airlines (and I think the FAA
>regs) prohibit the use of radios on board commercial aircraft (with
>the exception of those being used in the cockpit).

The FARs (federal aviation regulations) say the following:
Sec. 91.21 Portable electronic devices.

(a) Except as provided in paragraph (b) of this section, no person
may operate, nor may any operator or pilot in command of an aircraft
allow the operation of, any portable electronic device on any of the
following U.S.- registered civil aircraft:

(1) Aircraft operated by a holder of an air carrier operating
certificate; or
(2) Any other aircraft while it is operated under IFR.

(b) Paragraph (a) of this section does not apply to--
(1) Portable voice recorders;
(2) Hearing aids;
(3) Heart pacemakers;
(4) Electric shavers; or
(5) Any other portable electronic device that the operator of the
aircraft has determined will not cause interference with the navigation
or communication system of the aircraft on which it is to be used.

All airlines are operated under IFR (instrument flight rules).
Therefore, it is up to the pilot in command (PIC) to determine whether
or not we can use our scanners on a particular flight. If the PIC
(which is your captain) says it's OK to use it, then it's allowed under
(b)(5).

I just went to Baltimore last week via TWA. I brought my BC200xlt
with me on the flight. Before I went to my seat, I went and talked to
the flight crew. I first talked about flying in general (because I'm a
commerical pilot). After a couple of minutes, I said "oh, by the
way..would you guys mind if I listened in on the flight with my scanner
here? I'd really get a kick out of it." Well, they looked at it for a
couple of seconds and inquired whether or not I could transmit with it.
After informing them that I could not, the captain said
"well...ummm...ok, sure. But turn it off on takeoff and landing." I
was quite happy!

Well I listened in on the two hour flight. Listening to Center was
really weak. Whenever there was a frequency change, I had to hope that

the copilot would repeat the frequency when he was handed off. Most of the time he didn't, so I was screwed. When this would happen, I would search between 118 and 136 for our flight. It was a matter of timing, but I did manage to hear them talking on the new frequency once I found it.

When we started to descend to BWI, I got nailed by the stewardess. She saw that I was listening to something. I had a window seat on the right side of the plane, and I kept the scanner hidden between me and the body of the plane. It wasn't until we were 20,000 up and in a descent until I was caught. She said, "sir, what are you listening to?" I retorted, "oh, it's a radio". She went on to say "sir, the operation of electronic devices are illegal on this flight--you will have to turn it off right now!"

I then proceded to tell her that the captain specifically approved of me having it and listening to it. "Oh, well he certainly did not tell me about it so your going to have to turn it off." I told her to go and quite beligerant w/ me in tone and her gustures. If we had not been so close to BWI (and it was lousy weather there) I'd of told her to go and ask the captain NOW! I let it go at that.

After the flight, I told her to be sure and ask the captain about it. She did...and he told her. She turned to me and said, "well, the captain is supposed to inform me of it--I'm going to have a little talk with him." Geeesh...I felt sorry for the captain.

If you do get the captain's approval, be sure to let the flight attendant know about it...or you might end up like I did.

The Secret Service is in Town! I've heard our local police address them several times on the town's primary channel but have not been able to find the feds anywhere.

I've been trying from 163 to 168.00 with no luck so far...

will also be searching the 407-408.00 area (for body radio's).

The strange part is that there have been no announced VIP's visiting the area.

Any help on other possible frequencies will be appreciated.

In a previous article, rdervan@mindspring.com (Richard B Dervan) says:

>Delta specifically allows the use of "VHF Scanners" on their flights as long
>as it's not in the takeoff or landing phase. If in doubt, look in their "Sky"
>magazine under the information section toward the back.

Yep...the airlines in general have guidelines they issue. In fact,
TWA has guidelines too as I found out on the return trip to STL. I
talked to the crew for a while and then asked about the scanner. The
captain specifically said that their operating procedures do not allow
the use of any electronic devices at all. I certainly gave them no
problems about this; I was just lucky enough on the trip to BWI to have
a captain who didn't know TWA's policy on electronics (or maybe he did,
and didn't mind if I used my scanner).

I would of included this in my original post, but I ran out of my 60
minute session here on Freenet. Please excuse the grammer mistakes in
the last post; I was rushed :(

Source record: 273797

A freq counter can help you find the 'special' little freqs that various agencies use, but don't have licenses for. By getting near someone transmitting, you can quickly find out what freq they're on, then cross-reference to see who is licensed for it (if anyone). Good for police tactical stuff, and business things, especially for digging out those SMR users.

You might find this interchange amusing ... by chance it happened by me
the other night, on the Shortwave echo conference of the Fidonet BBS
network.

Message #232 - Shortwave
Date: 05-24-94 00:01:00
From: William Viets
To: John Smullen
Subject: Re: grove enterprises...

>I think the general consensus is that Grove and Monitoring Times are
>pretty much first rate.

John, there is, I fear, no "general consensus." Rather, I think, there are
only individual, anecdotal reports of purchasing and/or service experiences.
Grove's product (hardware) prices are simply competitive at best and their
shipping charges bear no semblance to reality. (Not that very many other mail
order outfits can restrain themselves from predatory markups on "shipping and
handling" either, to be sure.)

I think if I am ever reincarnated I want to come back as a direct mail
marketer...of ANYTHING. These guys have industrial strength chutzpah and it
obviously pays off for them very nicely, thank you.

Monitoring Times certainly contains at least as much info for enthusiasts as
most other publications in the field which I've seen, but on balance it is
written in elementary school-level prose at best and does not have the benefit
of any serious "editing" to clean it up. I refuse to believe that the majority
of MT readers are educationally- deprived dolts who cannot handle the English
language at any higher level than, say, My Weekly Reader. I for one am not
and so vent my wrath. If anyone has evidence to the contrary, lemme at it,
please.

The magazine's standing columns are full of (amateur) air and most of the features are just plain embarassing. Not gonna catch this package sitting on many coffee tables, nossuh. Grammatical errors, typos and syntax errors in 1994? Absolutly, totally unacceptable. The amateur- writer-supplied (read "free") photos are pathetic and it's pretty obvious that nobody in Brasstown owns a grease pencil with which to crop the crap-o-la. Most of 'em (the reader "photos") aren't worth the cost of the fillim it took to shoot 'em.

Grove takes to rant in the magazine. Very unprofessional. Bush-league at best. Period. Someone needs to go to "publisher school" and take Magazine Editorial Content 101. Get past it and move on. The monthly is as rough around the edges style-wise as it is in design, layout and paper stock selection. It has brought a whole new dimension to the "quick and dirty" el-cheap-o Flintstones Publishing, Inc., genre. The four-color covers don't and can't save it. Better a straight offset one-color issue, if they can't bear to spend any real money on production/design. At least then it would have the cachet of being "funky." Don't get me wrong, now. I don't think it should look like Harper's or Vanity Fair, but come ON, can we talk? The next step on the ladder is a homeowner association "newsletter," heh-heh.

To another pet peeve: I've yet to get a complete, lucid, written reply to any inquiry I've ever made to the company by mail or fax on any subject. Ever. (Of course the same is pretty much true from my personal knowledge of similar experiences with EEB, heh-heh.)

Remember the classic quote about the Timex/Sinclair "computer" 10 years ago: "Well, it's probably better than no computer at all." Grove too, in my opinion. I look forward to skimming MT and the Grove catalogs. But, sheesh. They sell some state-of-the-art goodies; why can't they publish any? I guess they're just like Wratte Shaque: the only game in town, so they get away with nearly whatever cheap-dip they want.

Thanks for providing the opportunity for me to get off on this, John. I feel better about'em already. But I think I'll go get a doggie biscuit now just in case I feel a relapse comin' on, heh-heh. Best, Wm.

i agree with duane whole hartedly. ALL radio hobbists should be concerned about what affects the WHOLE spectrum, not just "thier" small portion of spectrum. soon there will be no spectrum left for anyone to enjoy. That sounds very silly. Sounds like the only ones that will be left are the pirates. Maybe that will be the only amateur radio to enjoy in the future. I have a hard time immagining anyone going to jail and paying out very large amounts of money for listening to a radio. Shades of Nazi Germany in the 1930's and 40's. And is anyone at ALL concerned about the NJ laws that are trying to make their way into the lives of radio hobbiests?, the taxing and mandated inspection of all transmitting devices, inspections that could cost as much as 2000 to an individual per year??? Come on arrl, irca, nra, and the rest of the radio clubs, local and national. its time to do something now, not when its too late.

Source record: 273845

to the gentleman that had the question about the effectiveness of the lightening rods and wanted info on grounding techniques:
the rods are affective as can possibly be, they are not as likely to arch across to the camera as they already have a "low impedence" path to ground when they strike the rod, but this is not always 100 percent. as far as antenna grounding, motorola puts out a good little phamplet on grounding techniques. for a few pointers, use two arresters on your coax. one at the antenna and one at the entrance to the building. ground both of these to a good earth ground using as large a wire as practical. usually number 8 or larger. on the coax going into the building, bend the coax so it forms a right angle at the bottom of the lightening arrester where the cable enters the building. do not crimp the wire where it is damaged however. this 90 degree bend tends to act as a high impedence point for lightening and the lightening will tend to go through the arrester to ground rather than into the radio room. if the lightning doesnt go throught the arrestor, this high imppedence point will also tend to burn in two from the heat generated from a lightening strike, thus limiting the amount of lightening entering the building because of the disconnection. always use long ground rods, 8 feet or so is the norm and make sure regular maintenance is done on the entire system. and , as always, completely disconnect the antenna from the radios when not in use. even close by lightening strikes can damage the front end of a receiver because of the amount of electrostatic energy on the antenna. hope this is of some help. im sure there are more ideas out there. oh and one more thing. if you use an antenna tower, dont assume that just because its in the ground with concrete that it is lightening protected. lightening has been known to blow apart concrete tower bases causing the antenna tower to fall. always run grounds to the antenna tower, and on all grounds, run them with as little bend as possible. 73. brian. wb5kxw

4291. Frequency counter recommendation?

Newsgroup: rec.radio.scanner
Date: 1994-05-28 03:15:43 UTC
From: jerry@hnrc.tufts.edu
Message-ID: <1994May27.221543.2395@hnrc.tufts.edu>
Source record: 273727

Would anyone care to make a lower-cost frequency counter recommendation?
The more affordable models seem to be

Radio Shack 22-305 $100
Optoelectronics 3300 $130
Startek 1350 $130 list

I notice the Opto has a hold button while the RS doesn't. Not sure about the Startek. My intuition tells me this could be worth the extra $'s. Any comments?

Thanks.

4292. Re: can some PRO-43's be modified, some not?

Newsgroup: rec.radio.scanner
Date: 1994-05-28 03:25:12 UTC
From: Jerry Smith <Jerry.Smith@f747.n115.z1.fidonet.org>
Message-ID: <770116895@f747.n115.z1>
Source record: 273777

JD> From: jdewitt@rainbow.sosi.com (Jeff Dewitt)
JD>
JD> Is there any truth to the statement that some PRO-43's can be
JD> modified, and some not. I had a PRO-51, and I just returned it and
JD> got a PRO-43. The model number is 20-300.
(truncated)

The model you have should be modifiable. If it had an 'A' after the
number, then you would have the unmodifiable unit.

Product: Realistic Pro-43
Purpose: Restore full 800 Mhz continuous coverage

Modification is from the publication Monitoring Times
September, 1992 Page 107

** Warning...This procedure will void your warranty

** Do not attempt this modification unless you are familiar with small
component soldering. Performing this modification is done at your own
risk. If you don't feel comfortable doing the mod, DON'T.

** Static damage is quite possible as the modification involves work near
the microprocessor. A static strap is highly recommended.

** This modification restores certain portions of the 800 Mhz band that is
against U.S. federal law to monitor.

Tools needed...Fine point low powered soldering iron, solder wick or
de-soldering tool (I recommend the wick), pointed awl, hemostats or pointed
tweezers, small phillips screwdriver, solder.

1. Remove the battery, antenna and back cover (held in place by four
screws)

2. Remove the six screws holding the top circuit board in place.
Carefully unsolder the two antenna connections from the board. Bend the
antenna ground tab fully up form the board. Crefully lift the board,
unplugging the black connector at its base, and lay the board out of the
way on its bundle of colored wires.

3. Remove the two screws from the next board and lift it, carefully
unplugging the white connector at the bottom of the board. Lift it up and
lay it aside on its brown wire (which can be unplugged if necessary).

4. Unsolder and remove the metal shield from the final board, revealing
the microprocessor; note the row of diodes labelled D1-D5 above it. Only
diodes D1, D2 and D4 are present; assisted by a pointed tool, unsolder and

remove D4; the lone diode. (This restores full 800 Mhz continuous coverage which will use 30 khz stepping when appropriate.)

5. Re-assemble the scanner, paying particular attention to the alignment of the plugs. Test the radio by entering any frequency in the 800 Mhz band that could not be programmed before.

Modification is complete.

Source record: 273783

te> Are there any mods for A Shack Radio pro 39 Scanners
te> anywhere??
te> Any help would be apprecitaed! ;_

Product: Realistic Pro-39
Purpose: Restore full 800 Mhz continuous coverage

Modification is from the January issue of Monitoring Times- January, 1993-page 107

** Warning...This procedure may void your warranty.

** Do not attempt this modification unless you are familiar with small component soldering. Performing this modification is done at your own risk.

** This modification restores certain portions of the 800 Mhz band that is against U.S. federal law to monitor.

A fine tipped soldering iron, desoldering wick, small Philips screwdriver, long-nosed pliers and rosin core solder are required to perform the mods.

1. Remove the battery door, holder and batteries from the unit.

2. Remove the four screws from the back of the scanner and carefully lift the back off.

3. Unplug the two wiring harnesses at their connectors and remove the six bright colored screws holding the circuit board in place. Unsolder the ground wire from the lower right corner of the circuit board. Unsolder the two wire connections from the BNC antenna connector at the board. Carefully lift the board (grasping it near the Molex connector) and set it aside.

4. Remove the two bright colored screws from the next circuit board. Carefully unplug the two-wire connector. Unsolder and lift the rectangular metal shield exposing the diodes.

5. Carefully unsolder and remove diode D6 only; this will restore the missing frequencies which can be searched in appropriate 30 khz steps.

6. Reverse procedure to reassemble unit.

4305. What is SCA?

Newsgroup: rec.radio.scanner
Date: 1994-05-28 04:44:53 UTC
From: goldberp@iia.org
Message-ID: <2s6i85$nc8@ankh.iia.org>
Source record: 273847
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Could someone tell me, what SCA means?
The only info I have is:
"...67kHz SCA (Subsidiary Communication Authorization) signal.
SCA is subcarrier used by some stations to transmit bacground music for
stores, computer data and so forth".
I saw very simple and cheap receiver named "FM/SCA" (made in China).
Can I find its SCA station on my scanner (BC890XLT), provided that I know
freq. of its quartz oscillator (around 40 MHz)?
Any ideas (preferable by Email to goldberp@iia.org) would be greatly
appreciated.

4307. are ALL cellullar phone monitorings illegal?

Newsgroup: rec.radio.scanner
Date: 1994-05-28 05:40:16 UTC
From: lthomas@nyx10.cs.du.edu
Message-ID: <2s6lg0$229@nyx10.cs.du.edu>
Source record: 273822

I work at Radio Shack and the way I understood it, it was illegal
to listen to a cellular phone call even if you had an unmodified scanner
that could.
Well anyways. A customer called up and here is what happened>

me->hello, this is (blah, blah, blah)

guy->uh yes, I need to find out what frequency your cellular phones
transmit on so I can pick it up on a scanner.

me(mainly because I didn't want an argument)->It's illegal to scan
cellular phones.

guy->No, it's only illegal to listen on bands that scanners are not
supposed to recieve(informs me of why our scanners don't pick up certain
ranges(as if I didn't know))

me->well at any rate I can't give you those frequencies

guy->you won't give them to me?

me->I don't know what they are.(cheap cop out but I was worried about
what the laws really were and I honestly didn't know).

guy->(informs me I am something similar to a stupid jerk)

me->have a nice day
<-click->

So my question is, who was right. Even if I had known the freqs,
I would not have given them because of the principle of the thing, but
legally, who was right?

I do not speak for Radio Shack. I only mentioned it because it simplifies
my explanation

-Layne

uh, as of April 26, 1994 it is illegal to sell scanners that are "easily
modified" to receive cellular frequencies. I assume this to mean the
scanners can't already receive the cellular frequencies.

> - Are there any laws/regulations as far as carrying the unit onto the aircraft

Not as far as I know (I'm an airline pilot).

> - What do you do when you approach the security/X-ray area..

If asked, show security that it is, in fact, a radio and not a bomb, by turning it on. I usually ensure my Yupi is tuned to a commercial broadcast frequency in case anybody is feeling sensitive.

> - Any restrictions from the airline as far as turning on the scanner on-board
> during flight ?

It varies from airline to airline. You can normally use radios in flight, but not during take-off and landing (unproven risk of interference with aircraft equipment). You can usually find detailed information in the airline's in-flight magazine. Even if it's allowed you'll probably have to educate the cabin attendants who won't know the difference between a receiver (allowed) and a transceiver (forbidden).

If in doubt:

1. Ask the airline when you buy your ticket, or check-in.

2. Show the scanner to the Captain when you board. He'll probably ask you where he can buy one! (we love our gadgets!)

Hope this helps,

Chris

On may 28'th we will interview Larry Ledlow NA5E. Larry has just returned from an assignment with the un in Croatia and Bosnia. He will clue us in on the communications scene in that troubled part of the world.

On Saturday June 4'th we will take a look at Digital Audio Broadcasting or DAB. This high-tech system of broadcasting is in the wings and should be here near the end of the century. A few systems have been proposed for dab and a standard hasn't been decided as of yet. Our guest will be Ted Schober. Ted has been on the leading edge in the world of DAB and will give us a look into the radio of the future.

On Saturday June 11'th we will take a look at vsats, (very small apachure earth terminals). Vsats are the newest high-tech method of satellite communications. Our guest will be Bill Septmeyer. Bill is an engineer and founder of National Supervisory Network (NSN). Nsn is on the cutting edge of this new communications technology. So join us on the 11'th of June when we take to the sky on Spectrum.

>I like to take my portable (PRO-43) to Disney World in the summer and was
>wondering:
>- Are there any laws/regulations as far as carrying the unit onto the aircraft ?

No regs as to carrying it with you. I have taken mine all over the world with me on business travels. Some foriegn countries have laws against radios/scanners but no airline I know of has rules against carrring one. Now before anybody jumps in about the FAR's (Fed Air Regs) I am aware of what it states (I am a certified Pilot so I know them well), so let's not bombard the newsgroup with another discussion of the correct interpretation of the FAA FAR's.

>- What do you do when you approach the security/X-ray area before you get to the gate ?

I have it in my brief case and they x-ray the case. Only once did someone ask about it. I told them that it was an AM/FM radio (just like it says on the front of the unit). Never had any problems especially in the US. Even in Rome where they are EXTREMELY security aware I have no problems.

>- Any restrictions from the airline as far as turning on the scanner on-board
>during flight ?

Most airlines forbid the use of "AM/FM" radio's inflight with one exception I know of. DELTA. They will allow it's use during the enroute phase of the flight (ie not during taxi-takeoff-landing).

Jim

It may be illegal, but no-one is going to stop you. Just make sure
you have a copy of form FCC 740 completed for it as a non-certified
device imported for personal use.

If the bozos at customs ask "duh, can this thingy receive phone calls"?
act dumb and say "dunno, its not been tested yet, receives shortwave
nicely though. Bought it for listening to the BBC on vacation".

[Sarcastically put in the second paragraph... Nobody I know of to
present day have had any problems obtaining them in...except the
possible exception of Grove Enterprises -- he couldn't get his due
to his purpose being commercial resale, not personal importation.]

4315. Javiation still in business?

Newsgroup: rec.radio.scanner
Date: 1994-05-28 13:18:56 UTC
From: steven@sgb.oau.org
Message-ID: <CqIKzL.Lpo@sgb.oau.org>
Source record: 273813

Did Javiation go out of business? I have received e-mail that Javiation has not been replying to requests for orders or other information recently. I also have not -seen- anything from Jonathon lately either.

I am in the process of compiling a listing for name/addresses/phone numbers for overseas suppliers of scanning equipment. If I do not hear something on this soon, I will either have to include his entry with a comment of "may no longer be in business" or something, or not include it.

I know he had a problem with Monitoring Times (Grove Enterprises) accepting his advertising, and I also know he recieved a somewhat form letter from the FCC prior to April 26.

HOWEVER, in communicating with him afterwards, he indicated he would continue to export units to the U.S. if individuals explicitly request it.

Additionally, he has no offices in any U.S. Territories, therefore the FCC has/had NO jursdiction sticking their nose in his affairs in the first place.

While it's a longshot I may dispatch mail to him from a French e-mail address I still hold and see if it merits a response.

I feel sorry for all of you who bought from him, it seems he's not around anymore.

If he sees this, or someone can say they have bought from him or communicated with him RECENTLY, I'd appreciate a clarification! Thank you!

Wrong, *wrong*, WRONG, *WRONG* !!! :-)

As of April 26, it is illegal to import or manufacture . . .
It is perfectly legal to sell off existing stock (and my local RS has some 43's and 2006's they'd be happy to sell to you.

oooooooohhhhh!!! Bad news, arguing with Bill Nelson. He has a bad(!) habit
of being correct about what he says. What's illegal is producing and
importing (commercially) easily-cellular scanners after 4/26/94. There is
no current problem with selling these! At least not in the U.S.

In a previous article, billn@hpcvaac.cv.hp.com (bill nelson) says:

>If it is not against the airline's rules to use the scanner, then the
>stewardess has no say in the matter. It is up to the chief pilot. Being
>a commerical pilot, you know the authority of the pilot-in-command.

I was not aware of where the guidelines originate from within the
airline. I guess it makes sense that the chief pilot makes decisions
like this. On my return trip, the captain said that his F.O.P. (which I
think is the 'flight operating procedures' [not sure though])
specifically says 'no electronics'.

The FAR I cited in a previous post says nothing about the 'chief
pilot'. But I agree...I guess he would be the one to make the decision
for the whole airline. Of course, for anything outside of airlines, the
PIC is the one who makes this decision.

: I curious just how many have been confiscated in the past month. Anyone
: made it through? Congrats if you did (civil disobediance; an American
: tradition) its a stupid law and should be changed.

There should not be a problem, they are officially a non-certified device. You can import ANY non-certified device as long as it has the FCC form 740 included with it. Since it is not certified or approved by the FCC, there is no legal reason to prevent it. The customs staff are not RF experts in determine scanning capabilities. Therefore, they can not make that determination.

The law states that the FCC can not certify these devices. They don't. Another policy states with the use of the form, you can import up to three non-certified (or non-certifiable) devices for personal use. There is no mechanism to prevent it from occuring.

It is true, these units will never be certifiable under present law, and that is all the customs cares about. That being the case, there is a form to permit its entry, regardless of what it can do!

Furthermore, if you use a credit card and for any reason it fails to arrive, its the same as if you never ordered it, therefore it becomes an unauthorized charge. It then becomes a problem for the vendor -- and if its international, it can become a problem for the U.S. government to deal with -- because they do not provide a listing of what will not be accepted by model number or by manufacturer -- they told me "we do not make such a listing and do not plan to". For that reason there is nothing to stop you.

Since that holds true, to them its like any other non-certified device, therefore, if the paperwork accompanies it (for personal use limited to three devices per shipment), it gets entry.

I am in the process of putting together a lengthy listing of overseas scanner suppliers which will hopefully go up on Monday, I want it to be a memorable day (Memorial Day). I include the name, address, the phone numbers (voice and fax), and if they advertise credit cards or not. They were all valid as of January 1994.

I've just started reading this newsgroup and have been interested to see that a scanner can be modified to expand it's range.

I have a meagre PRO-44 (model 20-304, SN 010810) which covers 30-54, 108-174, 380-512. not too amazing I know - are there any mods I can make to this to increase it's frequency ranges. I couldn't find any mods on the FTP site mentioned in the FAQ.

many thanks,

Philip

You are misunderstanding. The chief pilot is the PIC of that particular aircraft - not for the whole airline. The management of the airline decides what is allowed - and the PIC may do so, if he/she feels it is safe. The PIC is NOT allowed to act contrary to the operational procedures of the airline - except in an emergency.

TD> Then, Grove has the nerve to actually state "the only way to
TD> buy one of these scanners is from stock imported BEFORE [their
emphasis]
TD> April 26, 1994." As we all know from other posts in this newsgroup
this TD> is outright bullshit.

Maybe you'd be happier if they'd said the only LEGAL way?? The TDDRA
is very specific in NOT allowing the importation, for sale OR private
use, of modifiable scanners. The fact that things coming into the U.S.
from Canada don't go through Customs, and stand a good chance of not
being intercepted, doesn't change the law.

14> Scanner-philes,
14>
14> I like to take my portable (PRO-43) to Disney World in the summer and
14> was wondering:
14>
14> - Are there any laws/regulations as far as carrying the unit onto the
14> aircraft ?
Not that I am aware of. I've done it many times with no hassle.

14> - What do you do when you approach the security/X-ray area before you
14> get to the gate ?
Like you know where you are going. <g> Seriously, carrying the handheld
is no big deal. Usually, I leave the unit on my belt. Never had a
problem.

14> - Any restrictions from the airline as far as turning on the scanner
14> on-board during flight ?
This is open for debate. Delta will let you, most won't. If you want to
operate the radio on board, the best thing to do is to ask to speak to the
pilot of the airplane and ask if you can operate the scanner in flight.

Enjoy your trip, Stephen...

Jerry

Although it does not receive shortwave, the Pro46 does a good job and is modifyable to get the whole 800 MHz spectrum. If someone knows reasons NOT to get the Pro46, please post, because I like what I've got, and I want to know if I am missing something!

I would have to agree with these concerns. Fortunately, we have a
"Crime Stoppers" program where you can call police anonymously with
a crime tip. One never has to testify, you don't have to give any
details about yourself (details like "I heard it on my scanner" can
also hurt their investigation if you gave it up front), and it is
possible to get a reward to boot!

I can hear the question: how can you get a reward if you are anonymous?
They give you a code number when you call in a report, and I guess
you simply provide the code when picking up the reward. I've never had
information that led to an arrest (or even to call them in the first
place!) so I can't say from first-hand experience.

: You forgot the biggie. DW prohibits them.

Oh hell, DW prohibits just about everything - I think they would prevent happiness if they didn't remind themselves that that was the business they were supposed to be in!

For example:

I've heard they prohibit breast feeding except in designated nursing facilities. Even so, my wife had no problem back in April 1990 - but we were prepared to have to make a loud stink about it!

In comparing Disney-MGM with Universal Studios, D-MGM really goes overboard with the "no photography, movie, or video" rules practically everywhere, using "copyright regulations" as a reasoning. Now I can understand on a soundstage or live backlot where this is a concern, but in one of their audience participation things? Besides, the copyright would be Disney's to decide if you can video/photo or not, unlike the soundstage/backlot situation where a film producer might share or own the copyright. Universal had no problems with using cameras and camcorders in the participation things.

Anyhow, so much for getting off topic.

Just use your scanner with discretion. I plan to for things here in Toronto at Paramount Canada's Wonderland, and probably later this year in Charlotte at Paramount's Carowinds. (Season pass holder - might as well use it as much as possible!)

>It would seem obvious to me that you must. ;-)

No, according to law it is illegal to listen for something you're not
suppose to. That makes "breather" guilty in 2 offences:
1. Unsolicited breathing.
2. Listening of private police conversations and using them for his own.
(He never called back again, right?)

To be serious I agree, that turning on scanner could be benificial for
the home/apartment owner. Assuming 2 things:
1. He'll not turn on cell-phone conversations by mistake.
2. Home burglar is not scanner hobbyist.

4345. Pro-43 TV Interference!

Newsgroup: rec.radio.scanner
Date: 1994-05-29 05:09:08 UTC
From: v-mattm@microsoft.com
Message-ID: <CqJszC.8x3@microsoft.com>
Source record: 273824

My Pro-43 picks up the local religious TBN Christian
Broadcasting Network, on 460.050, the primary police dispatch
channel, and it is very annoying! Only when there is actual
police transmissions, is this interference muted. The interference
is intermittent, and may die out when the sun goes down. The local
TBN station is about 20 miles away, but I don't know why the Pro-43
picks up continual, religious broadcasting, in a distorted manner.
I know that Grove advertises filters that are supposed to
weed out a lot of garbage, but I don't know if it would eliminate this
broadcasting.
One other point. I live in a 15 story apartment building, and,
when I lived on the 14th floor, I did not have this interference. Now, I
live on the 9th, and get it all the time. If I go to my Mom's building,
and she also lives on the 9th floor, I get the same interference. Are
these buildings "natural" receptors, and why, religious broadcasting, of
all things?

Thanks,
Matt

I wish to purchase a hand-held scanner soon.
The pro43 seems to have a good record; however it is almost 2 year old technology.
The bc2500xlt has nicer/better features, but at least early on had problems with the recharagable only batteries needing to be recharged ever few days.
Since my expected use would be during camping trips or spare of the moment requirements, the usability of standard AA batteries in the pro43 would seem to favor it despite its lack of 'modern' features.
Comments please.

4351. Trunking - Why not just...

Newsgroup: rec.radio.scanner
Date: 1994-05-29 12:20:35 UTC
From: hpeach@ca.uky.edu
Message-ID: <hpeach.110.000C57D6@ca.uky.edu>
Source record: 273789

Well, trunking has finally come to one of our local police agencies. They are using a GE 5-channel system with phone patch capabilities. The first two weeks of operation it was easy to keep up with them, but now they have introduced an buzzing transmission that moves around on the inactive frequencies every few seconds to mess up scanners.

A couple of us started talking about developing a decoder that would work with a PC to track the *virtual channels*, but then it hit us. Trunked systems will never lend themselves well to scanners because you can't scan multiple agencies on the same box (only one data channel can be monitored at a time). You would have to have a scanner for each agency so why not just buy a trunked radio.

So now the question:

What is to keep someone from just going out and buying a GE trunked radio and programming it to the proper frequencies?
Are there radio shops that will setup a trunked radio for RX only on a given set of frequencies - no questions asked?
Is the documentation available to do this yourself? If so, where?
If you want to listen to all talk groups, do you have to know the talk group numbers being used by the agency or is there some number you can enter that opens up the radio to all talk groups?
Has anyone out there already done this? If so, what other questions do I/we need to be asking?

I just thought it was time to introduce some of these questions to the group. Your thoughts/comments are welcome!

P.S. A local friend/radio shop owner tells us he does not believe trunking has a long-term future. He says that both Motorola and GE systems have had a lot of problems (some deadly) and he thinks some of the more spectrum efficient modes coming out will win out over trunking in a few years. (BTW, he will not program a trunked radio for us. As a radio dealer, he feels doing so for persons other than the licensee is unethical. I don't agree, but it is his shop.)

Scanners typically have a 5khz bandwidth. A better bet would be a cheapo
fm radio. I have used my DX-300 tuned to 67khz to monitor SCA from a
poorly filtered AM-FM portable receiver. Audio quality was not good but
it was readable. Some stations in my area have data of some sort at 67kc.

Try tuning to 19 khz for the stereo pilot then tune up to the center of the
L-R channel at 38khz. Signal levels seem to drop as you move up.

: The other day I was scanning and heard someone do an autopatch on the
: ham frequencies. I have a guess that this allows you to connect with
: the telephone system or to another repeater. Can someone explain this
: and the basic workings of the repeater system (and ham radios in
: general)?

an autopatch connects a radio repeater to the landline telephone.
autopatches are password protected, they require a dtmf access code.
for an autopatch to be useful, it must be in a repeater which is located
on a high mountain top for usable coverage. Many autopatches are also
repeater controllers which provide the line between the repeaters
receiver & transmitter plus the carrier operated relay. Advanced
controllers have synthesized voice, voice mail & the ability to control
several receivers & transmitters for multi-band repeaters systems.

Repeater use on VHF has become standard practice. Repeater use on UHF is
almost mandatory because of line of sight propagation. Multipath or
picket fencing limits the usability on simplex (direct radio to radio),
getting worse with distance & higher frequency.

A repeater consists of a receiver, transmitter, powersupply, controller,
and duplexer/diplexer. receiver & transmitter operate on different
frequencies, like 600khz on 2m ham - 5mhz on 460mhz - 45mhz on 800mhz.
the duplexer allows the transmitter & receiver to share the same antenna
by using sharp (narrowband) cavitys which either notch out the other
frequency of the repeater or pass the desired.

In major metropolitan areas with crowded repeater sites on hilltops
intermodulation problems have required the use of circulators/isolators
and additional bandpass & band reject cavity filters.

I don't think leaving a scanner on is all that great for crime prevention, especially if you leave it on your local PD frequency. This would certainly let a perp know when and why the cops are coming and give him an advantage. He could also steal the scanner and use it for additional crimes. It sounds good but leave it on another jurisdictions freq.

L>I'm soliciting opinions on the Universal M-1200 decoder, and
>products like it.

L>ACARS is an important feature, along with the run-of-the-mill
>HF decoding modes.

I use one for ACAR's. I'm about seven air miles from SFO and I think I am picking up about 50% of the on the ground originate traffic and most of the in the air traffic. YOU HAVE TO VERY CAREFUL with the scanner you are going to use!!!!!!! ACAR's requires a V E R Y W I D E band scanner. For example the PRO 200X series is useless. You'll need a scanner that has a high volume output. MY Yupi would not work with the M1200 until I boosted its signal. It helps to be close to a major airport and have the major carrier there an ACAR's users, for example Southwest is NOT an Acars user. If you have more questions well, Fire

> Peter

SCA is a fairly old method of adding an additional channel of audio to an existing FM radio station. I don't think you will find it used hardly anywhere else other than the 88-108mhz FM band. There have been several articles published over the last 10 - 15 years in magazines such as Radio-Electronics on how to add a simple SCA decoder to a regular FM radio. I modified one about five years ago by adding a single cheap IC chip (with a few other components) inside a radio, then connecting the decoded audio signal to the FM monoral front panel switch. I can't find the schematic now, but go to a decent library and look through their periodicals; I'm sure you'll find plenty of references.

4361. FREQUENCY COUNTER RECOMMENDATION?

LT> So my question is, who was right. Even if I had known the freqs,
LT> I would not have given them because of the principle of the
thing, but
LT> legally, who was right?

Its illegal to INTENTIONALLY listen to a cellphone conversation, no matter WHERE you hear it. And besides, ALL cellphones work on ALL assigned freqs (between 869 and 894 mhz for the base end, 824-847 mhz mobiles), you don't have any freqs that are assigned to different manufacturers cellphones.

Why can't someone design the Priority Channel on a scanner to not interupt regular scanning when nothing is on the selected channel. In other words: Everytime I use this feature, every two seconds you hear a dropout in a conversation on another channel. This seems to happen on all scanners I've tested. Seems this was an afterthought in design. It's a useful feature but annoying as hell when using it!

Actually, the rs counter is a lot like the PRO-43. You can use alkalines or rechargeables. If you choose rechargeables, you can have the counter recharge them for you when you plug in the AC adapter. Unlike the PRO-43 with its pair of female connections, the counter has a single switch-controlled female connector.

I prefer this arrangement, myself. I'll almost always be using it as a portable and I'd like to be able to use alkalines, which does not seem to ba an option with the Opto or the Startek. But . . . no hold button.
(Also, RS comes with an antenna, but not with a recharger.)

no sir, that's not normal. You should contact whatever company you purchased it from. It generally indicates something wrong in the audio output filter circuit to get an AC hum from the speaker. The fact that it is audible when unit is off indicates it might be dangerous, I.E.: catch fire!

please do not use it on AC until it is repaired.

: something like "I can't tell you because we *sell* information like that.
: If you really want it then you can come into one of our many convenient
: stores and buy a copy for XXX dollars."
:
: (Of course all of this said with that totally cheery salesman voice!)

Well, let's put this straight... If he was a good "regular" customer who has bought many times in the past, giving some information over the phone would not at all be inappropriate since the main purpose of Police Call is NOT to list cellular frequencies, and you did not say if he was calling from New Jersey (where the only Police Calls to be had are via mail order!)

Now about the information... It's legal to modify a scanner to receive cellular frequencies. It's legal to modify scanners that are already legally unable to be modified. It's legal to give out the frequencies to others, since they are information, not actually transcripts/tapes of calls! It's also possible to legally import them as non-certified devices as well, not specifically concerning yourself with "if" it can receive or not receive cellular calls. It would not be legal to "knowingly" import them as cellular scanners for resale. But as a non-certified FCC form 740 applicable device (ie up to three for personal use or for testing and development), it's 100% legal since the form and the fact it is non-certified means just that ... no data. The customs folks are not specialists in testing rf devices, to them any rf device is the same as any other, if it has no FCC id, its non-certified and qualifies for the form 740 import for personal use option.

Sounds like a classic case of intermod which is specific to the IF's of
the scanner and your particular RF microenvironment. Godd luck working it
out ... such things can be next to impossible.

The PRO-43 has been known to receive TV channel 20 all over the spectrum.

Hello all,

I will be attending the Milwaukee Mile 200 race afte those fine time
trials in Indianapolis this weekend. I'd like to take aling an HT
to monitor tranmissions between the crews and drivers.

So, my questions are these: Does anyone have a list of frequencies the
team will be using for this race? I have a list from the 500 this year.
Will the teams use the same frequencies? If not, is there another
resource I can use to get these frequencies?

Thanks to anyone that can offer assistance.

Erich

Hmmm...this is not really a 'bonus' as you seem to imply. First, the
200xlt searches in 12.5khz steps, while cellular uses 30khz steps.
So, you only pick up some of the cellular stations. Second, I pick up
cellular just fine between 900 and 920 mhz. I believe this is because
of the IF steps (something along those lines--not sure though).
Now...my question is: since the new ones are not supposed to be
modifiable, does this mean a person cannot pick up the cellular
frequencies in the 900-920 range? Hmmm...I dunno.

I will be visiting some folks in the Poughkeepsie area this weekend and like to get the freq for the NYS Trooper along I87 (NY Thruway) and I84 along the Newburgh area. I'll be coming up from Rt 17 in North Jersey and pick up 87. It will be helpful also if anyone has the Wappingers Fall and Poughkeepsie Police's freq too. I didn't have a chance to get hold of a copy of NY state's Police Call. This will be the first time I'm traveling with my PRO-43 and really like to see if I can pick up things outside my area.

Just like to know where there are along the way...

Thanks in advance

> Thanks.

Once again, it looks like its going to end up costing twice what I originally thought. I've been told that what I really want is automatic capture. Since I've yet to be disappointed by anything I've purchased after receive a range of opinions on the net, I'm very curious to hear any arguments for or against the OptoElectrics M1, Startek ATH-10, or Startek ATH-15. My primary use will be mobile, to determine what frequencies those around me are transmitting on.

Thanks much.

4389. Re: Priority Channel

Newsgroup: rec.radio.scanner
Date: 1994-05-30 23:34:00 UTC
From: tom.lackamp@vidgame.com
Message-ID: <ce.4723.696.0NCCBBD2@vidgame.com>
Source record: 273748

SC>Why can't someone design the Priority Channel on a scanner to not
SC>interupt regular scanning when nothing is on the selected channel...

Cal,

What you're hearing is the scanner momentarily jumping from
the active channel to check activity on the channel you've
programmed as priority. It takes a certain amount of time for
the synth to settle on the new channel and for the squelch circuit
to check for high-freq audio which indicates an idle channel. That
period of time, short as it is, shows up as a break in the audio
of the non-priority channel you might be monitoring at the time.

To avoid this audio interruption, your scanner would actually
need a second embedded receiver, from the front end all the way
back to the discriminator, including a separate synthesizer. It
could be done, but it would be mighty expensive, considering the
very limited benefit the second RF strip would provide. (Of course,
I can think of about a dozen situations where the simultaneous
two-frequency monitoring provided by such a system *would* be worth
the price - especially in a portable scanner, where it might not
be practical to carry multiple separate receivers if you don't
want to look like a super-nerd <g>.)

I share your frustration with the chopped-audio priority channel
mechanism. I seldom use this feature on my scanner.

Best,

Tom Lackamp

4391. Real-time DTMF decoder for Mac

Newsgroup: rec.radio.scanner
Date: 1994-05-31 00:14:41 UTC
From: theshark@uclink2.berkeley.EDU
Message-ID: <theshark-300594170656@sharkbite.hip.berkeley.edu>
Source record: 273745

The other day, I was reading the alt.2600 newsgroup, when I came upon a DTMF decoding program which uses the audio input source from the Mac (sys 7.x only) to spew numbers out into a text file or on the screen. It has somewhat good sensitivity, but the version I picked up was a demo, in which the author wrote in code that locks out three random digits. The fully functional version costs $25 and can be bought from the author, Carl Huben. His e-mail address is: gsmattes@vela.acs.oakland.edu

This is not an ad, just something I thought the scanner group would be interested in. The program is called Touch Tone Decoder 2.0

Message-ID: <9405310816094@artibbs.sccsi.com>
Source record: 273764

I have a Bearcat BC 200XLT, and I was wondering if anyone had any good modifications for it. I have already clipped the 10k&#65533; resistor that locks out some of the 800 Mhz range. I noticed that when I reset it, it has some frequencies on certain channels that I couldn't enter otherwise (like in the 87 Mhz range). Does anyone know how to enter a wider range of frequencies, and will the scanner actually pick them up? Thanks.

I agree with everyone else. I have had a 2006 and a Pro-46 for some time now and I am quite pleased with the 2006. It's well worth the investment and covers all the bands up to 1200 MHz. The 46 is not made by GRE and is certainly not as good as the 43. It is somewhat prone to intermod., but I got it at a great price and it's served me well as a portable & second scanner.

Harold G. Peach Jr. (hpeach@ca.uky.edu) wrote:
: What is to keep someone from just going out and buying a GE trunked radio
i have seen an add for a device which restarts the scan at those series
of tones during the repeater hang. Comsec Associates, Inc. 2219 W. Olive
Ave., Burbank, CA 91506

: P.S. A local friend/radio shop owner tells us he does not believe trunking
: has a long-term future. He says that both Motorola and GE systems have had a
: lot of problems (some deadly) and he thinks some of the more spectrum
: efficient modes coming out will win out over trunking in a few years. (BTW,
the lovely 220-222mhz spectrum will become home to 100 repeater pairs,
spaced 5khz. Amplitude compandered single sideband will be used with
3.1khz pilot tone. Uniden & SEA are making repeaters & mobiles. It will
be expensive & power inefficent, yet very spectrum efficient. And
because its 220mhz, it shound work great if co-channel & intermod can be
kept under control. This shouuld see popularity in large metropolitan
areas where 800 & 900mhz trunking bands are filled.
Motorola & GE systems have had problems, but what about LTR? EFJohnson
and Uniden have been making a killing with LTR. LTR repeaters can be
identified by a squelch crash at repeater key up and the 15 or so second
keep alive pulse. You should be able to hear as many LTR repeaters as
motorola repeaters.
I also heard about this variation of the motorola system where the
data channel can be used for voice when all channels are busy.

*** Welcome to rec.radio.info! ***

Welcome to rec.radio.info, a group that aims to provide a noise-free source
of information and news for the entire rec.radio hierarchy.

Two introductory articles about rec.radio.info are posted to the group and
to news.answers every two weeks. You are now reading the first article, which
explains what rec.radio.info is, and answers some Frequently Asked Questions.
The second article is titled "Submission Guidelines", and you only need to
read it if you want to submit an article to rec.radio.info.

You can skip to the next section of this article by searching for the next
" -- " string. The sections available are:
- What is the purpose of rec.radio.info?
- Why are messages almost always cross posted to rec.radio.info?
- What is a 'follow-up', and what does 'moderated' mean?
- OK, so now I know what 'moderated' means. Tell me more.
- What type of material is considered inappropriate?
- I do not have access to news, how can I get the information posted to
rec.radio.info?
- Will the material appearing in rec.radio.info be archived somewhere?
- I have a regular posting with timely information, is there a way to
speed up it's delivery, or automate for more convenience?

-- What is the purpose of rec.radio.info?

The purpose or charter of rec.radio.info is to provide the Usenet community with
a resource for information, news, and facts about any and all things radio.

All the other rec.radio groups are intended for discussions and general chit
chat about radio. Rec.radio.info will contain informational, factual articles
only. Follow-ups are redirected to an appropriate other group, and further
discussion (if any) will not take place in rec.radio.info.

In order to ensure that rec.radio.info contains only appropriate articles, it
was decided to create the group as a moderated newsgroup.

-- Why are messages almost always cross posted to rec.radio.info?

It provides a "tag" for each article to be assembled into a filtered
presentation in rec.radio.info (even with cross-posting, only one message, with

a unique Message-ID, is propogated across the net). This tag also facilitates a pre-existing method of dropping or cancelling the articles locally within the discussion groups if you don't want to see them. This accommodates individuals who want to separate the bulletins from the discussions, discussions from the bulletins, as well as those who are adamant about not reading another newsgroup and wanted to see everything all in one basket.

With the total size of Usenet (in number of newsgroups and total traffic) doubling every year or so, this is no insignificant contribution to reducing information noise and chaos. Making the discussion groups a catch-all, and making extra newsgroups filters on that catch-all, is also the most realistic way to implement such a scheme (It's not intuitively obvious what the charter, contents, and general appropriate topics for each and every newsgroup are. Seeing FAQ's and charter/intro postings in the home newsgroup is beneficial for new readers).

By cross-posting one only is adding a few tens of bytes to each bulletin (to specify the extra group on the Newsgroups line), but are adding the capability for very powerful filtering features available on most news servers, listservers and readers. Your local news guru could probably explain these features in more detail.

In rn, for example, according to Leanne Phillips in her rn kill-file FAQ, add a line of the form:
/Newsgroups:.*[,]rec\.radio\.info/h:j
either in ~/News/KILL (if you don't want to see rec.radio.info articles anywhere) or ~/News/rec/radio/amateur/misc/KILL (if you don't want to see them just in rec.radio.amateur.misc). The latter method means your kill file will only be consulted during rec.radio.amateur.misc (and hence runs more efficiently), and will probably work for most people.

In nn, according to Bill Wohler in his nn FAQ, add a line of the form:
rec.radio.info:!s/:^
in ~/.nn/kill (if you don't want to see rec.radio.info articles anywhere), or put the following lines:
sequence
rec.radio.info
rec.radio.
at the end of ~/.nn/init in order to see all the rec.radio.info bulletins first, then read the remaining rec.radio.* without the bulletins.

-- What is a 'follow-up', and what does 'moderated' mean?

If you are new to Usenet and are not familiar with the terminology, you might want to read the general introductory articles found in the newsgroup news.announce.newusers. Doing so will make your life on the net much easier, and will probably save you from making silly beginner's mistakes.

If you think that at this moment you are reading an echo, a conference, or a bulletin board, I'd also strongly suggest a trip over to news.announce.newusers.

For the rest of this article, I will assume you have a basic knowledge of Usenet terminology and mechanics.

A moderated group means that any article that needs to be posted to the group has to be accepted by the moderator of the group. Since we need to ensure that followups to an article (discussion) do not show up in the rec.radio.info newsgroup, the `Followup-To:' header line contains a newsgroup that is appropriate for disussions about the specific article.

-- OK, so now I know what 'moderated' means. Tell me more.

Rec.radio.info is a moderated newsgroup, which means that all articles submitted to the group will have to be approved by the moderator first.

The current moderator of the group is Mark Salyzyn. Submissions to rec.radio.info can be posted, or e-mailed to:

rec-radio-info@ve6mgs.ampr.ab.ca

Comments, criticisms, suggestions or questions about the group can be e-mailed to:
rec-radio-request@ve6mgs.ampr.ab.ca

But before you do so, please be sure to check out the "Submission Guidelines" article.

The influence of the moderator should be minimal and of an administrative nature, consisting chiefly of weeding out obviously inappropriate articles, while making sure correct headers etc. are used for the appropriate ones.

-- What type of material is considered inappropriate?

There are three broad categories of articles which will be rejected by the moderator:

1) Requests for information: rec.radio.info is strictly a one-way street. I receive information in my mailbox; I then post it to rec.radio.info. Requests for specific information belong in the normal discussion newsgroups. If your request gets answered, you might consider passing the answer on to rec.radio.info, though. Especially if you can edit it into a informational, rather than a discussion, format.

2) Obvious discussion articles, or articles that appear unsubstantiated.

3) Commercial stuff: a relatively unbiased test of a radio product would be accepted, but any hint of for-profit might be reason for rejection. For three reasons: This is not the purpose of the list, for-profit is a controversial topic, and this list may be passed onto Amateur Packet Radio (where for-profit is prohibited except under certain provisos).

rec.radio.swap (or possibly comp.newprod) may be more deserving of the posting in any matter.

Similarly, copyrighted material generally cannot be used. If it's TRULY worthwhile to the net, I would recommend obtaining permission from the copyright holder. Please note the source, and if permission was given. I

reserve the right to make the final decision concerning appropriateness in all situations. In most cases, a brief summary of, or pointer to, the copyrighted information may be all I can allow.

-- I do not have access to news, how can I get the information posted to rec.radio.info?

brian@UCSD.EDU (Brian Kantor) has kindly supplied a mail list server for rec.radio.info. Non of the articles will be digested, due to their size, so you will receive individual mailings for every article posted to the group.

Mail sent to radio-info@ucsd.edu will be forwarded to the moderator and thus is an alias to rec-radio-info@ve6mgs.ampr.ab.ca

To subscribe and unsubscribe via the listserver; the format for that is

sub address radio-info
unsub address radio-info

where 'address' is your full mailing address. Send this request to

listserv@ucsd.edu

Note that the server will automatically delete any address that bounces mail. If you leave the address portion blank, it will try to deduce your address from the mail headers. This may not work if you are on bitnet, milnet or some other non-Unix host, so it is recommended to put your return address in any case. For example:

sub mymailbox@myhost.mydomain.mil radio-info
or
sub MEMEME01@DMBHST.bitnet radio-info

or something like that.

-- Will the material appearing in rec.radio.info be archived somewhere?

< Dated information here >

Yes. Still firming up details at the moment but here is a preliminary list:
- unbc.edu as maintained by Lyndon Nerenberg <lyndon@unbc.edu>
- nic.funet.fi maintained by Risto Kotalampi <rko@cs.tut.fi>
saved to /pub/dx/text/rec.radio.info currently stored as numbered files.

Effectively this means that anything you post to rec.radio.info will be permanently stored, so your work will not be lost.

-- I have a regular posting with timely information, is there a way to speed up it's delivery, or automate for more convenience?

Yes, there is! It may take a bit of chatter with the moderator, but we are willing to take responsible people and provide them the means of posting the articles directly from their site. We will try everything we can as we fully realize that DX (distant signal) and astronomical data can be somewhat

transitory. We are also willing to allow regular posters of information the same courtesy, even if the information is not as time critical.

We refer to this as self-moderation, which is partly based on the model for news.answer. This requires co-operation and good will to be beneficial to the community in the rec.radio hierarchy.

I suggest reading the posting guidelines for more information. I am open to suggestions.

I thank the following individuals for their input into this article:
rec.music.info moderator Leo Breebaart rec-music-info@cp.tn.tudelft.nl
rec.radio.broadcasting moderator Bill Pfeiffer wdp@gagme.chi.il.us
Paul W. Schleck, KD3FU pschleck@unomaha.edu
Ian Kluft, KD6EUI ikluft@uts.amdahl.com

--

Bud_Jamison@f1010.n202.z1.fidonet.org wrote:

: Maybe you'd be happier if they'd said the only LEGAL way?? The TDDRA
: is very specific in NOT allowing the importation, for sale OR private
: use, of modifiable scanners. The fact that things coming into the U.S.
: from Canada don't go through Customs, and stand a good chance of not
: being intercepted, doesn't change the law.

Well unfortunately, the TDDRA is doing a lousy job of preventing them...
[very sarcastically said]

The U.S. Customs are NOT RF specialists, as such, they do not know the
difference between a computer peripheral and a radio receiver. They do
not need to know. FCC Form 740 is for importing for personal use ANY
non-certified device. Let me repeat, the form that customs requires is
FCC form 740 for ANY NON-CERTIFIED DEVICE.

The TDDRA is very specific that the FCC can not approve receivers capable
of receiving cellular frequencies or is easily modifiable to do so.

Guess that means these scanners are NON-CERTIFIED. They meet the U.S.
Customs requirements as a device that has no FCC CERTIFICATION. This
means they NEED FCC FORM 740 FOR ENTRY. If it is there, they could care
less what it can do, it PASSES. Simple. There is NO listing of what is
acceptable or not acceptable, and on equipment which is NOT APPROVED by
the FCC, there is no means a person in the U.S. could see or inspect the
unit OR its CAPABILITIES. Therefore, these units WILL go through customs
if form 740 is properly completed. Nothing will prevent it.

Personally, I could care less about the "law", and will ignore it anytime
I wish to.

If you want to get specific, it says "manufacture or importation for use
in the U.S." or something to the same affect/meaning. Since a person could
be purchasing/importing for USE when OUTSIDE the U.S., and only will be
possessing it IN the U.S., not necessarily USING it in the U.S., there is
a large gaping hole available should it ever be needed.

Since you are obviously pro-cellular ban, I'll be listening next time you
use your cell-fone!

Sorry I missed the start of this thread, but I think this may have
something to do with transformer hum in a Pro-2006, right? A common
problem, at least it appears that way from the number of times it
crops up here.

Don't be too worried, it's just the transformer humming, a common problem
as the unit ages. (It still hums when turned off because the switch is
after the transformer!)

The best solution if the scanner is out of warrantee is to use a 12 volt
wall-wart and leave the AC cord unplugged. This has the added benefit
of reducing overall power dissipation so that the scanner stays cooler.

Rob

My opinions, not my company's.

Message-ID: <2seot7$rj3@babyblue.cs.yale.edu>
Source record: 273756
Cross-posted to: rec.radio.scanner,rec.radio.amateur.misc

My Realistic Pro-2004 scanner has a sticky key. It looks like something has indented the number 6 key, causing it to stay pressed intermittantly. I've removed the screws that hold the PC board in place which contain the keys, but I'm still unable to remove the board. Does anyone know if this is glued to the membrane face, or if it's attached some other way? I'm thinking if I can get behind the membrane front, I can iron out the indentation of the keypad and fix the problem. The service manual has been of no help in this regard.

Reply via this board or email, I'll read (and much appreciate) either!

Thanks,
Kirk J. Smith (KD6RCT)

: JOHN JEWKES, OHSU SAFETY TEAM MEMBER

Sorry, John. You are incorrect.

Just about all PRO-2006 scanners have a hum, while they are plugged in.
Apparently, there is power through the transformer, even with the radio
turned off. It is normal, and there is nothing to worry about.

New York State Thruway Frequencies are 453.425 and 453.525 alternated along the entire Thruway. These are repeaters. Input (Mobile) is 5 mhz higher. The Thruway Authority now patrols I-84 as well, so the same frequencies apply.

Other frequencies of interest:
155.565 NY State Police. Used for Air Surveilance/Radar
154.665 NY State Police car to car
155.505 NY State Police, Troop K barracks (Dutchess County)
155.920 NY State Police. Troop K Cars (Dutchess County)
460.025 Town of Poughkeepsie Police Dept.
39.040 Dutchess County Sheriff
158.850 Wappingers Falls Police Dept.
156.045 Mid Hudson Bridge Authority (Newburgh/Beacon Bridge)

Keep in mind that New York State Law does not permit installation of a scanner capable of receiving police frequencies in a motor vehicle. Happy Monitoring.

Rich

>actually made by GRE of Japan. Don't sell them short. There are bad ones
>out there, mostly made by AOR.

Keep in mind that until the 2004 came out, RS scanners were pretty bad -both
by design and manufacturing. RS now has good desgns (thanks to GRE), but the
manufacturing is still hit and miss. Out of the 4 RS scanners I have owned,
only one has not given me some type of problem. QC on the 200x series seems
to be better than many other models (although my 2005 has been slowly going
deaf since I bought it in 1989 - most freqs above 800 Mhz don't come in well
any more).

: In DC, these cameras are al over the place. For the morning/evening
: newscasts, you can see the images from these cameras. They monitor rush
: hour congestion. As far as I can tell, they are live video, B/W. I have
: no idea how the video signal is transmitted.

: Anyway, stay tuned to local news when the system is up and running.

The DC cameras are transmiited to a traffic operations center located
on Lessburg Pike, next to the State Police behind the Pentagon. They
are currently sent via coax for the most part, with a few down at the
WW bridge on fiber tied to the coax. New cameras being installed on I-66
outside the Beltway will return via fiber all the way to the ops center.
I know this because I just finished the design for it!

4411. New Kid wants advice...

Newsgroup: rec.radio.scanner
Date: 1994-05-31 14:20:28 UTC
From: nstrauss@netmare.corp.sgi.com
Message-ID: <Cqo7u5.HJr@odin.corp.sgi.com>
Source record: 273766

No, not that kind of New Kid...

:-)

I'm interested in this whole scanning thing, sounds like
the sort of vicarious fun that makes up most of my life.

So what I'm after is a bit of advice on hardware. I was
thinking that a portable unit might be easier for me, since
I tend to be on the road to various places a lot. But
which one? Lots o' folks seem very happy with their
Pro-43's. Any thing out there that is in the same class
that I might want to consider? And what's a reasonable
price. I assume that RadioShack isn't gonna be changing
their prices a lot from place to place.

Getting that 225-400MHz military band if a big interest of
mine.

Also (yes, I like to place un-reasonable demands on people
I haven't ever met), does any one have any good freq's in
the SF Bay Area to get me started? I live on the peninsiula,
Menlo Park area.

Thanks in advance, post or email, your choice!

4412. ICOM R1 TROUBLES ???!!

Newsgroup: rec.radio.scanner
Date: 1994-05-31 15:21:01 UTC
From: reider@acrux.GSFC.NASA.GOV
Message-ID: <2sfkkt$1hd@paperboy.gsfc.nasa.gov>
Source record: 273772

My new R1 seems to be working oddly. When it scans it skips over active channels. Adjusting the squelch doesn't solve my problem. If I directly dial in a channel it does pick up the strong active signal, but if I scan over the freqs the scanner just goes right over it. Any reasons ??

Let me add that it does pick up some channels sometimes, but it seems to be skipping active channels alot of the time.

Any help would be appreciated.

If the hold button is the only thing stopping you from buying the RS model,
there is a fairly easy mod (does require soldering) to add a hold button.

Source record: 273768

In article <hpeach.110.000C57D6@ca.uky.edu> hpeach@ca.uky.edu (Harold G. Peach Jr.) writes:

>Well, trunking has finally come to one of our local police agencies. They are >using a GE 5-channel system with phone patch capabilities. The first two >weeks of operation it was easy to keep up with them, but now they have >introduced an buzzing transmission that moves around on the inactive >frequencies every few seconds to mess up scanners.

This is one of the "nice" features that the GE system has to discourage scanner users. From a trunked system design point of view, I think it is a good idea.

>So now the question:

> What is to keep someone from just going out and buying a GE trunked radio >and programming it to the proper frequencies?

We use Motorola instead of GE. In order to program a Motorola radio on a trunked system, you must have a "key file" that gives your programming software access to the system ID of the trunked system you want to put a radio on. Also, our Smartnet II system has a feature called talk group affiliation. Every time someone turns on a radio or changes "channels", it is recorded by the central controller and logged in the system monitoring PC. An invalid ID on a radio would show up as a red flag. Since you have to have an ID to "see" that trunked system, and we only allow IDs that we've turned on, we would log any strange IDs that showed up.

If we wanted to, we could use our SIMS controller (this shows who is on the system, etc.) to disable the mystery ID. An inhibit bit is activated in the offending radio and it will go to "sleep". The only way to "wake" the radio back up is to turn it own within range of the system that killed it and have it reactivated. The service software can not reactivate the radio. This is an effective way to disable lost/stolen radios to keep a) someone from listening to your system, and b) dramatically reduce the market value of radios that someone might try to re-sale.

> Are there radio shops that will setup a trunked radio for RX only on a >given set of frequencies - no questions asked?

They could be risking their dealership, not to mention opening up a mess of possible legal action. From the adds in the radio trade publications, Motorola is actively enforcing their copyrights and patents.

> Is the documentation available to do this yourself? If so, where?
> If you want to listen to all talk groups, do you have to know the talk >group numbers being used by the agency or is there some number you can enter

>that opens up the radio to all talk groups?

You need to know the fleet mapping of the system you are using. This determines the talk group numbers, to some extent. With something like 4000+ talk groups on a Type II Motorola system, it could take a while to "guess" the talk group.

>P.S. A local friend/radio shop owner tells us he does not believe trunking
>has a long-term future. He says that both Motorola and GE systems have had a
>lot of problems (some deadly) and he thinks some of the more spectrum
>efficient modes coming out will win out over trunking in a few years.

I think there will be some improvements in the existing technology (i.e. digital) but the "trunking" concept itself appears to be fairly sound. Motorola has something like a 90% market share in the public safety sector, with GE playing catch up (their new systems have some neat features). Nextel is building out a nationwide digital system using Motorola's newest trunking technology. With backers like MCI, Motorola, NTT, and a major cable company (Comcast, I think), they must be doing something right.

>(BTW, he will not program a trunked radio for us.
>As a radio dealer, he feels doing so for persons other than the licensee is
>unethical. I don't agree, but it is his shop.)

Good for him. Hope he stays in business for a long time and earns a nice living.

Hi all:

I picked up a pro-55 with the following
crystals and was wondering what they
were used for.

1. 156.21 2. 155.415
3. 158.745 4. 154.160
5. 154.650 6. 39.46
7. 158.790 8. 10.595
9. 10.140 10. 37.850

Also next to the crystals there is
a switch for each crystal with a choice
of (low, high, uhf).

Any help would be appreciated,

Mike A.

>My new R1 seems to be working oddly. When it scans it

You did not mention if this is in "memory" mode or "VFO"
mode. If you have "skip-scan" enabled, channels will be
skipped in a VFO scan if you have them stored as such in
the skip channels (70-90?). You may have inadvertently
stored some skip channels. The only reason channels will
be skipped in "memory" mode is if they are masked, but
you would have surely noticed this, since masking causes
the display of the channel to blank.

Netters:

Is there an archive of undocumented features or helpful hints for
operating (not modifying) various scanning receivers?

I discovered the following while playing with my newly-acquired PRO-46
(forgive me if this is something that people already know!):

To directly enter and listen to a frequency *without* first
programming a channel:

Squelch fully counter-clockwise
press MANUAL
enter frequency (do not press ENTER)
press UP or DOWN (press again to "single-step")
If you decide you want to save frequency, press MONITOR.

Later, you can assign the desired "monitor" frequency to a "channel" as
described in the manual.

Similarly, to scan from a keyboard-entered frequency *without* first
programming upper/lower limits or calling up a channel number, follow
the steps above, but use a normal squelch setting. Turn on DELAY for
this scanning mode.

|> Motorola is actively enforcing their copyrights and patents.
|>

I have heard of communities that will allow you to buy or lease the radios and then have them programmed for receive-only for particular services if you are granted a permit. Permits may be granted to the press or to handicapped individuals (such as the blind) who may have valid safety concerns that might be addressed by monitoring the fire channel. In the case of the press, the system can issue commands to put those radios to sleep if there is something going on that they don't want monitored. Volunteer police, civil defense and fire workers are usually allowed access for monitoring in their car or at home. If you have a valid reason, approach your public service officials about it. Another valid user may be neighborhood watch groups.

I would like to see this concept carried through to licensing of citizens in general if you fit certain criteria (such as no recent criminal history, you are a registered voter, etc). The privelege could be revoked instantly if needed.

Here's my two cents:

I have been using an Icom BC-74A supply/charger for my 7100 for over a month now. The voltage, jack size and polarity all seem to match, and I have noticed only the slightest warmth from the yupi -- both when charging and when running -- unlike what many folks seem to be reporting.

Of course, your mileage may vary...

Clay_Schneider@att.com

The opinions expressed are strictly my own -- who'd want them anyway?

From: jackson@longlast.cs.nyu.edu
Message-ID: <2sgbjn$3uj@slinky.cs.nyu.edu>
Source record: 273774

There was one very important time that my scanner
came into assistance while dealing with the police.

I became very sick within a few short hours and needed
to get a squad out to my house. I dialed 911, which
was followed by ringing and then silence. I tried to
hang up and try again, but I couldn't get a dialtone for
about four minutes.

I was very tired from vomiting and was breathing heavy
into the phone. I decided to turn on my scanner, when
I heard "he's still breathing! I can still hear the
breathing units!" followed by acks. I said into the
silence, "I cannot hear you! But I can hear you over
my police band radio. If you can hear me, please transmit
to your units!" That was followed by "I've established
contact, units. I can hear him, but he can't hear me. He is
monitoring our transmissions, though" over the air.

The phone company provided a bad trace and as I looked
out the window, five police cars surrounded my neighbor's
house and doused it with lights. I told the dispatcher
I was down one and he transmitted the same.

When the first officer came in, he asked me why I didn't
answer the dispatcher when he answered the phone. I
told him about the silence. He picked up the phone, heard
the silence, and said [in a very snide voice, and after asking me
if I had electricity because the lights were out when he
arrived] "you don't have any phone service, whaddaryou talking
about?"

Yeah, whatever, [bud]. (aka not a literal translation)

--> Thanks in advance, post or email, your choice!

Can't Really help you on the HardWare side of it. (I only own a
pro-46, and it doesn't have 225-400 Military.) As for the FREQ's, try
getting either Police Call or a book called "Gary's FCC Frequency
Almanac". THIS book is the be-all and end-all of scanning lists. They
break down all of the FCC listings into a state wide book, then split it
up by county, then city. VERY DETAILED! Has everything from
Police-Fire-Local Goverment to Taxi, T.V. Station (for remotes), power
companys and Trunked 800 services (With who they are assigned to!)

I've got a first Edition book with was pumped out in '92. The address
on the copyright is Bob's Publications, 706 W. 43rd Street, Vancouver,
WA. 98660. <Kinda in my neck of the woods too.>

Hope this helps...

Hi Cal...
The old heathkit scanner had a priority channel that was a separate
receiver. It only "spoke" when there was a signal on the priority.
Probably was xtal based, it was 15+ years ago!

>of a copy of NY state's Police Call. This will be the
>first time I'm traveling with my PRO-43 and really like
>to see if I can pick up things outside my area.

NYS Thruway: 453.425 and 453.525 alternate along the entire
length of the NYS Thruway. Inputs are 458.425 and 458.525
(listening to the inputs will tip you off to nearby units).

F-1 for NYS Police Troop K (eastern side of the Hudson River
- covers the area you'll be visiting) is 155.505
Base/155.520 Mobile.

F-1 for Troop F (western side of the Hudson - covers the area
you'll be driving thru to/from NJ) is 155.535
Base/154.935 Mobile.

Other NYSP freqs:

F-2 154.665 Car-car
F-3 154.695 Emergency channel - bulletins/special broadcasts
F-4 155.565 Tactical
F-5 155.370 Statewide police intersystems
F-6 Tactical/surveillance - varies - try 154.845, 155.070.
F-7 155.475 Nationwide law enforcement
F-8 155.625 Data

Some banks in the state cruisers have a different channel setup
but still have all the above freqs.

Also check 42.140 for troop-troop and radar details

Poughkeepsie PD: 155.13, 155.415, 155.37, 155.475.
Wappingers Falls PD: 154.83, 155.37, 156.21, 158.85.

LifeStar medivac helicopter (based in Poughkeepsie):
155.235/.280/.340/.385/.400 plus all state/county/local public
safety and Medcom freqs.

>Just like to know where there are along the way...

Hey, it never hurts to know. :-)

Having given you all the above info. I need to tell you that mobile use of a scanner capable of receiving police freqs is illegal in New York State (without permission). In reality, though, I've never heard of them enforcing the law unless one is interferring with law enforcement activities. IOW, don't chase ambulances and don't be caught at a crime scene with a scanner in your car. I've driven in/thru New York for some 22 years with all sorts of antennas on my vehicle (from multiple mag mount antennas on my car or van to a groundplane antenna on my motorhome) and never been stopped.

Source record: 273771

Joseph Jesson (joe@netcom.com) wrote:

: Pager formats are either Golay or Pocsag at 600bps and 512/1200 bps.
: This is most of the formats however Flex is being introduced at 6400bps.

Golay sends the address at 300 baud and the message data at 600 baud.
POCSAG has been run at 512, 1200, and (I believe) 2400 baud. I'm wondering
if that 6400 number for Flex is a typo and should be 2400, too.

: Started to write a pager decoder for a pc (serial port). The
: pager address, or CAP code, is programmed into the pager.

: --Joe

This should require tapping into the scanner circuitry. You're receiving
FSK signals (unless your picking up a link frequency between the paging
terminal and paging transmitter). If you're writing code to decode the
pager data already, then you're probably way ahead of me.

Someone asked what FSK was. FSK stands for Frequency Shift Keying. In
order to represent 1's and 0's, the carrier is shifted to either of two
frequencies around the center frequency. One represents a 1 and the other
represents a 0. Pagers use a two-state NRZ-FSK like I described. The NRZ
(non-return to zero) means that the transmitter doesn't return the carrier
to the center frequency between "bits". This would provide synchronization
information that, in an NRZ system, must be obtained in other ways. POCSAG
sends a preamble before a transmission that is used to provide bit
synchronization (as well as to allow the pagers to sleep and prolong battery
life).

Sorry to hear that your area PD is going trunked. It's a bear to monitor.
My city and employeer went trunked about a year ago. They also throw a lot
of anti-scanner devices at you to try and get you to turn off your scanner.
You might want to get with someone who has an 800mhz scanner and hear what
it sounds like.

Brian

p.s. Radio Shack Pro-43 is a very good scanner.

: Motorola is actively enforcing their copyrights and patents.

I don't see that setting a radio up for receive only is going to violate
either copyright or patent law. I suspect that such a modification would
make it illegal for transmission however, since it would no longer be type
accepted.

> sensitive counter.
> Mike

Well, according to Optoelectronics' "20th Anniversary" catalog, the
cheaper Model 3300 is more sensitive than the Model M1 in some ranges.
It surprised me too, but here is what they print:

Input Sensitivity (Typical)

Model 3300	Model M1 (50 Ohm input)
10MHz	<15mV	<5mV
27MHz	<300uV	-
150MHz	<300uV	<500uV
450MHz	<350uV	-
800MHz	<3mV	<3mV
1GHZ	<3mV	<10mV
2GHz	<25mV	-
2.4GHz	<40mV	<50mV

Of course, what they advertise and what the things can do may be two
different things. I just ordered a 3300 this morning, so we'll see..

I was surprised to find that the counters come with *no* antenna.
Also, shipping is a bit out of proportion. The salesperson originally
said $15 for UPS 3-Day, but I eventually got $6 UPS ground (I'm in no
hurry). On something the size of a deck of cards, this seems a bit
steep. I've shipped breadmaker machines UPS ground for $3.50...

4448. Mobile Radio Resources?

Newsgroup: rec.radio.scanner
Date: 1994-06-01 04:43:17 UTC
From: carmean@rain.org
Message-ID: <2sh3l5$s53@rain.org>
Source record: 273679

I found an incomplete copy of what appears to be an _excellent_ reference on California HF/VHF/UHF systems called "Government Radio Systems," by an outfit called Mobile Radio Resources. It gives very complete information about agencies, office locations, office and unit codes, repeater input and output frequencies and CTCSS (PL) tones, transmitter locations, and more. It's got a fantastic amount of detail! More than Gene Hughes' "Police Call" detail editions.

Anybody know if these folks still exist, and how to get ahold of them?

4457. FCC License Data Sources

Newsgroup: rec.radio.scanner
Date: 1994-06-01 07:00:17 UTC
From: bill@thd.tv.tek.com
Message-ID: <2shbm1$oa3@news.tv.tek.com>
Source record: 273681
Cross-posted to: rec.radio.scanner,rec.radio.info

[last changed 08-Apr-94]

Changes preceeded by "|". Please e-mail corrections and additions to me.

INTRODUCTION

This is a list of FCC license data sources available to scanner listeners. The FCC master contains a wealth of data about every non-government license in the United States. Most of the sources below contain a subset of this data, although a few contain all of it. Government licenses are not administered by the FCC, and the data is not available to the public.

If you are interested in purchasing the data, you might want to consider forming a co-op of people in your area to share the cost. As far as I know, this is legal since the information is in the public domain. However, most software supplied to view or manipulate the data is copyrighted and must be purchased separately by each user.

Prices are rounded to the nearest dollar and include shipping, if known.

C.E.T.

CET sells records of all stations inside a 30-mile radius for $80. (Major cities cost extra.) A 70-mile search costs $178. The data is provided on floppy disks and is available in ASCII columnar and comma-delimited formats.

CET does not provide data for licenses that do not contain specific geographic coordinates (i.e., mobile-only systems) or specific operating frequencies (e.g., amateur radio).

To do the search, CET requires the latitude and longitude of the center of the 30-mile radius. I calculated mine from a USGS topographic map I obtained at a local nautical supply store. Alternatively, you can obtain the coordinates for your town from the University of Michigan's geographic name server. Run "telnet 141.212.99.9 3000" and enter your zip code. For my area, the server returned the coordinates of the main post office.

CET can be reached at 800-445-0297.

GROVE

Grove sells FCC data on disk by state. The first state is $40, and each additional state is $30 (add $10 for CA, FL, TX). The disk comes with a database search program. Grove Enterprises can be reached at 800-438-8155.

MICROFICHE

Lee Reynolds (lee@tosspot.sv.com) has made available copies of the entire FCC master on microfiche for $75 a copy. There are three sets in all - by callsign, geographic area, and frequency - for a total of about 200 fiche. | His current set is from early 1993. E-mail Lee for more information. [As | of 8-Apr-94 the above e-mail address was not valid. If you know how to | contact Lee, please let me know.]

The Bearcat Radio Club sells the FCC master by state for $15. Bearcat Radio Club can be reached at P.O. Box 291918, Kettering OH, 45429.

PERCON

PerCon sells a variety of FCC data on CD-ROM and floppy. CD-ROMs are available by state, region, or category, and floppies are available by state. Also available is a CD-ROM of the entire US (2.5 million records). Data is updated approximately every six months.

State floppies are $35 per state. CD-ROMs are $100 each. Quantity discounts available. PerCon can be reached at 716-386-6015.

POLICE CALL

This is probably the most cost-effective source of public service license information. The detail is limited, but the information that is there is often more useful than the FCC master. For example, an entry in Police Call that reads, "Portland Police, Net 3, North Precinct," reads, "Portland, City of" in the master.

Police call is available in 9 volumes covering different regions of the US. It can be purchased at Radio Shack stores for $10 per volume.

SCANWARE ASSOCIATES

ScanWare Associates sells a PC-based database program called the FCC Frequency Retrieval System V2.0. It comes with FCC data for one state, covering all services from 10 kHz through 2036 MHz. Data is updated approximately every six months (last update was Dec. 1, 1993).

Cost is $35 for the first state and $20 for each additional state. (Add $5 for CA, FL, TX, NY.) Quantity discounts available. Fully working shareware copy downloadable from their BBS at 206-871-4228 (FCC200.ZIP). ScanWare Associates can be reached at 206-698-1383 (voice) or 206-698-8207 (fax).

APPENDIX

Here is table of data fields in the FCC master. Fields provided by various products are indicated by "*" or the field length, if known.

Yes. Mobile Radio Resources, 1224 Madrona Ave, San Jose CA 95125,
408-269-5814. The Sixth Edition is the most recent, with an almost-seventh
for the Golden Gate area which replaces the listings in the 6th for
the 9 Bay Area counties. Those two books are $27.50 and 17.50,
respectively. (No connection with MRR, just a satisfied customer).

I will assume that you are looking for scanner crystals.

Radio Shack is actually one of the best places to order them (lowest price).
If you don't like that option, try JAN Crystals in Florida. Call for their
800 number (800-555-1212).

You're in luck. I grew up in Atherton. I just moved and have no more need of all my peninsula frequency info.

Most of the PD freqs for San Mateo County are in the 488-489 Mhz range.
Menlo Park is 488.3375 Atherton is 489.0875
East Palo Alto (always active) is 488.5375 (or .3875 cant remember right now)

I'll bring in a disk tomorrow and e-mail you some freqs.
You may also want to look into joining the BASE scanner club.

If you send me your USPS address, I can mail you some good frequency info from Bob Kelty's Government Radio Systems book.

Yes we had a letter from the FCC, infact several but all in responce
to letters I sent to them and non of the replies were "form"
letters that threatened us with anything. The statement that was printed
in MT that we had been "forced" to stop advertisng was not quite
true. I understand from Bob Grove himself that he also a letter from the FCC -
what that said I have no idea whatsoever.

If it had 800Mhz coverage, it was probably the 200XLT. If it did not, it was probably the 100XLT. Both are good scanners, but a bit dated now. For the right price, the 200xlt would be a good choice. What catalog did you see them in and for how much?

A too sensitive counter is a pain in the butt to use on the bench.
It wants to lock on all the local broadcast stations and paging
transmitters instead of the radio you are servicing. A counter
with 500 mV sensitivity is plenty sensitive enough to read LO
frequencies. Many of these "sensitive" counters are in plastic
cases so you can't even put a step attenuator on them to tame
their wild counting. The last thing you want on a counter is an
antenna. That just makes stray signal pickup worse.

A quick look through the latest Japanese CQ magazine shows no new
adverts for an improved 7100. I my experience, that's a pretty good
early warning (for at least a month or two).

I've had my yupi for about a year and a half and still enjoy it. The
going price in Tokyo (as of a month or so ago) seems to be about
Y48,000 or about $

>like to clean up the appearance but still have decient reception.

There are duplexers (diplexers) and triplexers, but they are frequency
specific. I doubt you could find one to match the frequency ranges you are
interested in. You dont rellay need a triplexer to do what you are doing.
Just using a 3-way splitter would do the same thing. Since you are only
receiving, you don't need the isolation. Yes, using a 3-way splitter will
give you 1/3 power at each antenna connector. The other problem is finding an
antenna that can cover the frequency range of the R-100. Several may
advertise this range, but in truth no simple wip antenna can be resonant
accross such a wide frequency range. The Diamond D-505 mobile has a 20dB
preamp built in, and would probably do well, but costs over $100 A 10 to 20dB
preamp might be a good idea if you plan on using a 3-way splitter.

Yes. The is Bob Kelty's "company" (mostly just him). He lives in San Jose
and is a real frequency guru in CA. I think he worked on Beyond Police Call
as well as the California section of Monitor America. He is also a ham. He
always gives out good info on his 444.8 repeater (can be heard around the Bay
Area). His books are by far the best available. You can call him at
408-269-5814 or write him at 1224 Madrona Ave, San Jose CA 95125-3547 to
find out if there is a distributor in your area. He will also sell them
direct (hard copy or on disk)

No 7200 GTi as far as I know but the new AOR AR8000 is due out within the
next 2 weeks (ahem, touch wood.....)

On paper its features look very impressive, and I suspect its performance
will be imeasurably better than anything other handheld that has worn the AOR badge
in the past.

Price in the UK is set as 449.00 so is slightly higher than the
street price of the MVT-7100.

>2.4GHz <40mV <50mV

I did sensitivity tests on my Opto 2810 counter. Here they are.......

I don't have regular access to special equipment but one day when I had
a few spare moments, I spec'd out my Opto 2810 frequency counter's
sensitivity over various frequencies. I used a Marconi 2022D signal
Generator which outputs from 10KHz to 1GHz and a few feet of an
extremely low loss Andrew cable. All readings were taken when a solid
lock on the frequency occured. Using other instruments, I was able to
get the unit to lock on a signal as low as 5 Hertz and as high as
3.5Ghz. The high end required great amounts of power and I didn't want
to blow the front end so I didn't try and take it above 3.5GHz. The
measurements that follow are over the Marconi's frequency range.

Input B: (10Hz to 50MHz input)

Frequency db

10KHz 1.5mv
100KHz 1.5mv
250KHz 1.6mv
500KHz 1.7mv
750KHz 1.8mv
1Mhz 1.9mv
5MHz 2.2mv
10MHz 2.2mv
25MHz 2.5mv
40MHz 3.2mv

50MHz 3.6mv
60MHz 4.4mv
70MHz 5.0mv
75MHz 5.5mv

Input A: (Amplified 1MHz to 3GHz input)

Frequency db

1.75MHz 24mv
2MHz 17mv
3MHz 2.9mv
4MHz 1.5mv
5MHz 800uv
10MHz 230uv
20MHz 110uv
30MHz 80uv
40MHz 75uv
50MHz 80uv
60MHz 90uv
75MHz 110uv
100MHz 160uv
125MHz 175uv
150MHz 210uv
175MHz 270uv
200MHz 380uv
220MHz 480uv
240MHz 750uv
250MHz 1.2mv
Switched to prescale (200-800MHz) at this point
250MHz 1.2mv
300MHz 1.3mv
350MHz 1.5mv
400MHz 1.4mv
450MHz 1.3mv
500MHz 1.0mv
550MHz 1.0mv
600MHz 1.1mv
650MHz 1.1mv
700MHz 1.1mv
750MHz 1.4mv
800MHz 1.3mv
850MHz 1.8mv
900MHz 2.5mv
950MHz 3.0mv
Switched to prescale (800MHz-3GHz) at this point
950MHz 3.0mv
1GHz 3.5mv

Hope this is of some use,

David

The purpose of the frequencies sound like police, fire, and public works.

The switch by each crystal socket is set to the band of the crystal
pluged into that socket. The "low" of for something like 39 to 50 mHz.
The "high" is for something like 148 to 170 mHz, and the "UHF" is
for somewhere around 450 to 470 mHz.

For sale,

RS Pro-51. About three months old. Have original box & papers, includes ni-cad batteries. In absolutely **MINT** shape, has only been used at home.

Bought an Icom R1 (for it's small size, of course) and that's why I'm selling the RS scanner.

Asking $265.00 OBO.

Please e-mail to work address or phone.

Thanks,

Ken

In article <2s5mh5$6fr@usenet.INS.CWRU.Edu>, el124@cleveland.Freenet.Edu (Mike Wilson) writes:
|> The FARs (federal aviation regulations) say the following:
|>Sec. 91.21 Portable electronic devices.

[...paragraphs (a) and (b) omitted...]

|>------
|> All airlines are operated under IFR (instrument flight rules).
|>Therefore, it is up to the pilot in command (PIC) to determine whether
|>or not we can use our scanners on a particular flight. If the PIC
|>(which is your captain) says it's OK to use it, then it's allowed under
|>(b)(5).

Actually, no. You forgot to quote 91.21(c):

In the case of an aircraft operated by the holder of an air carrier operating certificate or an operating certificate, the determination required by paragraph (b)(5) of this section shall be made by that operator of the aircraft on which the particular device is to be used. In the case of other aircraft, the determination may be made by the pilot in comand or other operator of the aircraft.

I'll spare everyone the formal definition of "operator", but suffice it to say the pilot is NOT the operator of a commercial flight. The operator of a commercial flight is the company (ie United, TWA, etc), not the pilot.

Thus 91.21(c) explicitly removes the decision from the pilot and gives it to the company. If the company says it's prohibited, the pilot has no authority under the FARs to permit its use.

California Penal Code:

Section 623.6 Eavesdropping on confidential communication transmitted between cordless phones; Punishment.

(a) Every person who, maliciously and without the consent of all parties to the communication, intercepts, receives or assists in intercepting or receiving a communication transmitted between cordless telephones as defined in subdivision (c), between any cordless telephone and a landline telephone, or between a cordless telephone and a cellular telephone shall be punished by a fine not exceeding two thousand five hundred dollars ($2,500), by imprisonment in the county jail not exceeding one year, or in the state prison, or by both that fine and imprisonment. If the person has been convicted previously of a violation of Section 631, 632, 632.5, 632.6 or 636. the person shall be punished by a fine not exceeding ten thousand dollars ($10,000), or by imprisonment in the county jail not exceeding one year, or in the state prison, or by both that fine and imprisonment.

(b) This section shall not apply in any of the following instances:

(1) to any public utility engaged in the business of providing communications services and facilities, or to the officers, employees, or agents thereof, where the acts otherwise prohibited are for the purpose of construction, maintenance, conduct, or operation of the services and facilities of the public utility.

(2) To the use of any instrument, equipment, facility, or service furnished and used pursuant to the tariffs of the public utility.

(3) To any telephonic communication system used for communication exclusively within a state, county, city and county, or city correctional facility.

(c) As used in this section and in Section 635, ``cordless telephone'' means a two-way low power communication system consisting of two parts -- a ``base'' unit which connected to the public switched telephone network and a handset or ``remote'' unit -- which are connected by a radio link and authorized by the Federal Communication Commission to operate in the frequency bandwidths reserved for cordless telephones.

[interesting description of the innards of trunking protocol
removed to save space]

I'd say trunking is the wave of the future. After all, it allows the system to utilise whatever RF channels are free, rather than require the user to select a particular frequency. If you need more proof, cellular phones are just a special case of trunking :-)

Now, as to being able to monitor a trunked system; if you have a detailed description of the signalling protocol, there's no reason you couldn't build a processor which interpreted the signalling and tuned a receiver to the appropriate frequency. All very easy in theory, of course. Things are a bit tougher in practice as the manufacturers feel (rightly) that the trunking protocol is their property and a competitive advantage. Motorola and GE are unlikely to divulge the bit-level details of their trunking protocols. Motorola, especially, has been running an ad campaign which emphasizes their proprietary rights.

Can you monitor a trunked system? Sure...the ease with which you can monitor the conversations depends on how sophisticated your monitoring hardware is. I don't believe a dedicated hacker would have too much trouble building hardware to decode enough of the control channel signalling to follow a talk group. But, what happens when they go to digital modulation? Or encryption? It's all a matter of how badly you want to listen and how much you're willing work to do it.

I am crazy about my recent acquisition of a PRO-43 - having lots of fun with it. I have one minor complaint about it, though.

The case itself seems to be painted with some kind of dull gray coating that easily scratches off, letting a shiny gray surface show through. I have barely had this radio for a month now and it already looks old and beat up! Still works great, of course.

Maybe I should have been more careful with it, but I would think a portable unit should be somewhat rugged.

Note: all the national forest frequencies would be too numerous to list.
I'd suggest purchasing the book referenced above.

Nope. Bill is right. The April deadline was for MANUFACTURE and
IMPORTATION of cellular-capable scanners. There is no ban on SALE of any
scanner (yet).

I'm already licensed. Drivers, SSI, birth certificate, college records, etc.
If big brother wants to keep an eye on me he already has lots of info!!!!!

I can see having a license for listening to certain frequencies, its done
in lots of socialist countries and works wonders for oppressing the masses and
keeping the ignorant exactly that. The show that never ends is the stupidity of
governments (and municipalities as you now propose) attempting to legislate
common sense/morality through the restricted access to public airwaves by
those deemed undesirable. Does some one with a history of chronic traffic
violations get his receiver permit revoked so he cant listen to the local PD
or meter maids?

This is really some STUPID CRAP!

I called Icom about this. They said they don't make one but thought someone else might. Unfortunately, I forget the name they suggested I try. They also suggested I could workaround the 3-inputs switching problem by soldering solid jumpers across them, which I did. I have the unit hooked to a discone in the attic, with the unit near my computer. (Yes, *I know*, not such a good idea, but this is my idea of "multimedia".)

No, no, no. You've got the meter all wrong! It should be

patient: "Doctor. It hurts when I do that." (demonstrating)
doctor: "Don't do that."

Try reciting both versions out loud a few times. You'll see what I mean.

Hello fellow r.r.s. folks!

I am new to 'scanning' and now a proud owner of a PRO-46. This is a wonderful little radio, but it does have one feature (or bug) that bothers me--that awful BEEP every time I press a key. Sounds like the original Pong video game. It's ALWAYS at the same level, even with the volume control all the way down, and it's downright deafening when I listen with headphones!

Does anyone know how to defeat the beeps? I was hoping there would be some clever special keyboard command to turn it off, but I'm not afraid to go hacking around inside. Help!

Moy Wong (moy@xp.psych.nyu.edu) Dept. of Psychology, New York University

I'd like to get my hands on the frequencies used by Great America
in Santa Clara, CA.

Anyone got 'em handy?

Last time we went there, they squawked about my having a 2M on my side
and told me "scanners aren't allowed in here". I pointed out that I
was a licensed HAM operator, and needed my radio in case of an
emergency. They bought that!

Now my curiosity is up, and I want to know what they're so hot and
bothered about keeping quiet...

From what I've read, the mod on the Pro-43 is major league stuff, with
desoldering and resoldering necessary. The mod for the 2006 is simply
cutting an easily-found diode.

I would suggest you also look at the Pro-2026, a nice mobile, easily
modified, now on sale for $150 (regular price $230)--an excellent radio,
and an excellent price.

Just want some more info about using a freq. counter. If I understand correctly, I could bring a handheld unit near the local cop shop, fire station, Pub. Wks, etc. to find the xmit freqs being used inside?

I am currently using a PRO-34 and Police Call (and now Beyond PC) mixed in with a lot of sweeping small freq. bands looking for new channels to program. I get the main ones but could spend years searching for Tac2, etc. Any help in this area would be appreciated. Thanks.

Yep. I do as a matter of fact.

Many balloonists use CB because it's cheap and because there aren't any licensing issues. There's no set channel so the thing to do is ask one of the crew. If you're at a large balloon event, this is where you'll find most of the balloonists.

Commercial balloon companies often use one of the VHF business channels. This is where I would concentrate my scanning assuming your scanner doesn't cover CB.

There are probably a few on GMRS and there's a few (like me) that use ham radio -- normally 2 meters (Hams make great balloon crew :-) The problem with ham radio is that you need a ham in the balloon and one in the chase truck to be legal. You also can't use ham radio for commercial activities which can get into a lot of grey areas when it comes to ballooning. I just fly for sport so it's worked out great.

Some balloonists use 123.3 or 123.5 in the aviation band for communication. Some have received specific licenses to operate on other frequenicies. This is also commonly done at the larger balloon events. In this case, the event organizer may apply for a waiver from the FCC to allow operations on other frequencies to avoid congestion. To operate an aircraft radio in a balloon requires the filing of FCC Form 404 and $35. This is also true for the chase truck where the form is 406 and the fee is $70. Because of the hassles, cost, and lack of frequencies, there aren't many who use aviation for general crew communications. However, many balloonists do carry a handheld in the balloon particularly if they fly near an operating control towers.

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part in bulletin boards, networks, or publications which charge for service without permission of the author. Free distribution is encouraged.]

This introduction is intended for people new to the scanning hobby and is oriented to scanning in the USA. It tells where you can buy your first scanner, what features it should have, where to get it repaired if required, how to get frequency information, and mentions a few scanner clubs worth joining.

Why Scanning?

Every day and night, scanner hobbyists are entertained by what they overhear on their radios. Police cars, fire engines, ambulances, armored cars, trains, taxis, airplanes, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss strategy with his advisor from a 415 MHz radiophone in Air Force 1, or a team of G-men protect him while transmitting in the 167 MHz range?

Listen in the 46.61 - 49.97 MHz range to your neighbors deal drugs over their cordless telephone, or as their conversations are picked up and transmitted over the airwaves between 49.67 and 49.99 MHz by their sensitive baby monitor intercom.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots.

Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

You can even listen to the order taker's wireless microphone at the local McDonald's restaurant on 154.6 and 35.02 MHz!

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the ECPA. Change is in the wind -- it will soon be illegal for companies to sell scanners which cover the cellular phone frequencies, but sales by private individuals will still be allowed.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have recently enacted laws against listening to cordless phones, but it's currently legal to listen in most states. You can find out about these restrictions in a 39 page paperback, ANARC Guide to U. S. Monitoring Laws, compiled by Frank Terranella, available for $7.50 from ANARC Publications, P.O. Box 462, Northfield, MN 55057.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners bear the Realistic label but are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend AOR brand scanners.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you

get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners almost always provide more audio than portables, and portables are usually more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band unless you live in a very rural area where this band is not used. Usage of the 800 MHz band is growing by leaps and bounds.

If you're not sure whether you'll like scanning, don't want to spend much money, a 16 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often poor.

Deluxe scanners can be controlled by a personal computer, although this feature isn't important to most scanner owners.

Currently, the more popular scanners include the Uniden/Bearcat 760XLT (a/k/a 950XLT) and Radio Shack PRO-2006 base/mobiles, and the Uniden/Bearcat 200XLT (a/k/a 205XLT) and Radio Shack PRO-43 portables.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so. Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801, can extend reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and

ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be somewhat more prone to lightning strikes because they are not at "DC ground."

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores like Service Merchandise and Circuit City sell scanners, but carry just a few models. Department stores, like Sears and Montgomery Wards, sometimes offer scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 300 S. Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- National Tower Company, PO Box 15417, Shawnee Mission, KS 66215. Telephone (913)888-8864.

- Marymack Distributing (Katy, TX) sells Radio Shack scanners at discount. Telephone (713)392-0747.

Many ham radio dealers, like Amateur Electronics Supply (Milwaukee, WI, (800)558-0411), also sell scanners.

Used scanners may be found at hamfests, flea markets, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

If you are handy with a soldering iron, you may be interested in modifying your scanner to add features or enhance its performance. Be warned this usually voids your warranty. Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

ftp.cs.buffalo.edu
garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117) |

KD4MOJ maintains a scanner modification server for people | without FTP access. You can request a list of scanner | modifications by sending electronic mail with the words GET | INDEX.TXT to FTPmail@exchange.tlh.fl.us

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here are least two companies which repair scanners:

1. Electronic Repair Centers (telephone 708-455-5105) - Several people have been pleased with good repair service from Electronic Repair Centers in Franklin Park, Illinois. Although they are not authorized to perform warranty work, this outfit has been repairing Bearcat scanners for several years. They charge a flat rate of fixing scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

2. G & G Communications (telephone 716-768-8151) - This family owned company repairs scanners and stocks parts for several older models. G & G sometimes buys old scanners, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is the Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores.

I also recommend the book, Monitor America, 2nd edition published by SMB Publishing, and available from Grove Enterprises for about $25. This single edition contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's 168 page Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 6th edition is available from Grove Enterprises for about $19. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200) and Kneitel's sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

Grove enterprises sells FCC license information on floppy disks. Disks for each state are sold separately, and the information is basically the same as the FCC "state sort," i.e., transmitter location (state/city), callsign, licensee name, and type of license.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio users to identify their operations with their assigned call letters, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immedi-

ate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

The world's largest scanner club is the Radio Communications Monitoring Association (RCMA). Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are $24.00 per year, which includes the monthly RCMA Journal, which consists of approximately 95 pages. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz.

Inquiries about RCMA membership should be sent to RCMA General Manager, P.O. Box 542, Silverado, CA 92676, USA.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,

Springfield, OH 45503.

AOSC questions can also be sent electronically to:

rccons!aosc_hq@telerama.pgh.pa.us or
dave.marshall@f240.n108.z1.fidonet.org.
FidoNet: 1:108/240.0

AOSC also has a MEMBERS & EDITORS Scanner related echo, AOSCNet, distributed via FTN on 6 BBS systems, and via Internet Mailing list. Rick Christian advises these strict rules for the AOSCNet Scanner Radio Echo (as of 2/1/94):

1. No discussion of cellular modifications or discussions on how to monitor cellular transmission.
2. No discussions on topics which would violate the ECPA '84, TDDRA '93, (18 USCA 2510 et seq.) or Communications Act 1934 & 1984 as amended (47 USCA 705), i.e., decoding/reception of paging, cellular, encrypted stuff, descrambling etc..
3. No Aliases.
4. No discussion of Shortwave or Amateur Radio material (except SAREX).

For info on the ECHO only, contact:

R.E. Christian, AOSC PA/AOSCNet Founder
PO BOX 12763,
Pittsburgh PA 15241-0763.
FAX: 412-831-5860.

Internet: rccons!aosc_pa@telerama.pgh.pa.us
rccons!aoscnet_hq@telerama.pgh.pa.us
rick.christian@f220.n129.z1.fidonet.org
FidoNet: 1:129/220.0

To receive a file of info on the All Ohio Scanner Club via Internet send to: rccons!ftpmail@telerama.pgh.pa.us

In body: get aoscinfo.zip

This will send a UUENCODED info packet to you. The file contains an outline of the material you will find in the American Scannergram, the AOSCNet, and an application for membership. (Note: This file will not be sent back to *.fidonet.org addresses.)

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members sometimes sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. A one year subscription is available by mailing a $10 check, payable to Kim Moran, to:

The Command Post
attn. Kim & Ted Moran
6143 W. Touhy Avenue
Chicago, IL 60646

Many CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (708)852-1292.

Here is a tentative meeting schedule for 1994. All meetings will be held on Saturdays at the Destiny Restaurant, 1440 Rand Road, Des Plaines, IL:

February 19
April 16
June 18
August 13
October 15
December 10

Bring a notebook and your appetite.

Okay, folks... I've gone and bought myself a Pro-2006 based on a lot of recommendation from this group. The model on the back is listed as a 20-145A. The clerk told me that it is impossible to find one of the earlier models. So, I turn to you, my scanning perrs, for help! Does anybody know of any mods to restore coverages to this unit? Also, what other tricks can you get this unit to do? I'm looking forward to hearing from you. E-mail responses are preferred! Thanks in advance to all!

This is amazing !!! I was just thinking about the exact same time today
when I noticed my 3-weeks-old PRO-43 showing these "paint" being
scratched off all over and showing the "shiny gray surface".

I thought I was handling it with care when I carried it around.
A radio that cost this much should have better physical design (paint)
done.

For those interested in the subject of freeway cameras...

I design these systems. A few I know of, and their comm links..

Miami (Golden Glades) Fiberoptic to leased T-1 lines
Jacksonville (Under construction) Leased T-1 and 900 Mhz analog
Orlando - Fiberoptics
DC - Coax and Fiber
New Jersey Turnpike - Leased T-1 lines
Milwaukee - Fiberoptics
Long Island - Coax and Fiber
Various CA systems - Mostly Fiber and Leased Lines

There are many others. The only one that a "casual" viewer might
have a remote chance of "tapping into" may be Jacksonville, FL.

From: surfer@pipeline.com
Message-ID: <2sjjek$qos@pipeline.com>
Source record: 273599

Well, I'm considering taking a plunge and getting a more powerful general coverage scanner. I have a little PRO-43 that I like, but I would like a computer interface and wider coverage and more channels. I don't want to get too much larger (physically) than the AR-3000A since I travel extensively but don't need optimum portability, and the specs on it look good, but I don't know anyone who's used one. I'm new to scanning and haven't started receiving the monitoring mags/newsletters I've signed up for. Is this the best box I can get in this size? Does it sing or suck? Many thanks for your wisdom!

4507. RE: ARE ALL CELLULLAR PHONE MONITORINGS ILL

Source record: 273653

re bills thought that listening to images of cellular communications isnt illegal:
sorry bill but the actual law wording is very clear. the wording says the type of communications that are illegal to intercept, not the frequencies. ecpa covers a lot more than cellular phones. cellular phones are considered communications not intended for monitoring or reception by the general public and are therefore illegal to monitor via ecpa. doesnt matter if you use a scanner, or tv, or whatever. 73.

4508. Hallmark Card Mod

Newsgroup: rec.radio.scanner
Date: 1994-06-02 04:15:34 UTC
From: urbina@novax.llnl.gov
Message-ID: <1994Jun1.201534.1@novax.llnl.gov>
Source record: 273633

Hi all. Some of you are familiar with this device, and I revisit it only to introduce others to a less expensive choice than Radio Shack's Analog Voice chip.

After reading some threads on alt.2600 about the modifying of Hallmark message cards for making redboxes,(see above newsgroup for info on that) I thought it would make a nice peripheral for a scanner.

So I went to the local Hallmark shop and picked up a message card for $7.50 +tax. What you have is a 1/4 inch thick card, you open it up and you see a speaker grill, and on the left hand side is a switch for recording and playback and a button to press to start playing or recording.

Carefully cut around the border of the card and remove the cardboard to expose the circuitry. Inside some plastic framework you will see a small speaker, a small piezo mike attached to the cardboard, a neat battery pack that holds 4 1.5v watch cells (6vdc), a tiny make/break switch and a postage stamped size circuit board that has only 4 discrete components on it plus the die (covered by black epoxy) of the integrated circuit. A .22uf cap and a 4.7uf electrolytic cap plus two small signal diodes make up the discrete components. A DPST switch is attached to the circuit board.

The IC, made by ISD (Information Storage Devices) of their Chipcorder line, records only 10 seconds of audio and has no microprocessor addressable lines. I surmise the bandwidth is still narrowband voice with a Hf cutoff of around 2700hz.

Put everything in a small project box and use a 9v battery through a regulator or use the small battery pack that came with it. For you more adventurous people you could probably find room for it inside the RS Pro-200x scanner models.

If you replace the microphone with a better quality one like an electret mike or capacitively couple your scanner's earphone out to the chipcorder you can make a tiny 10 second recorder. With transistor switches instead of mechanical you can trigger off of your squelch, recorder out, etc.

Applications include: 1. record DTMF tones for later play on a decoder.
2. record that last transmission that you couldn't
understand too well.
3. Damn near anything !

The good thing about this device IMHO is that you get the whole system for only $8.00 whereas with the Radio Shack chip, while you get 10 more seconds of record time and it is addressable, can cost you considerably more $20.00 or more finished project.

I tested mine out with my Yupiteru and it records great !

-Guy

4509. decode freq inv with SSB

Newsgroup: rec.radio.scanner
Date: 1994-06-02 04:34:50 UTC
From: urbina@novax.llnl.gov
Message-ID: <1994Jun1.203450.1@novax.llnl.gov>
Source record: 273635

Some of you know about this already, I just want to reintroduce it for the benefit of new users of this newsgroup and those who don't know about it.

While scanning a particular band in the lower VHF, I came across a transmission using frequency inversion. Owning a Yupiteru MVT-7100 myself, I'd heard that by changing the modulation to SSB that one could decode such transmissions. I switched to USB and step to 50hz. After tuning around a while, I was able to hear the conversation in the clear, although an annoying 1khz tone was present also. I admit vague knowledge of SSB, though I think this was due to the carrier injection oscillator of my unit. Anyway through the use of an equalizer, one could probably filter that tone out.

I was surprised how clear I could hear the conversation by tuning around on USB, it really works !

I'm pretty sure it was a radio shack device that was transmitting frequency inverted intelligence, they're the only manufacturer that makes freq inverted cordless phon/...oops err telecommunication devices. (I live in CA) :)

-Guy

4510. Re: PRO-46 BEEP: How to quiet?

Not afraid to go inside? I don't know of any keyboard commands to delete the beep, but have a note on it, I haven't tried it, so always be careful enough to undo your doings.

Find pin 80 on the logic ICU, IC 1489. Pin 80 will be the first pin on the left side of the chip, counting UP from the diagonally cut corner. (have the diagonally cut corner at the lower left) Follow the trace from there to L201. At a convenient place, cut the circuit trace with a very sharp razor knife. This should silence the beep.

FTP to oak.oakland.edu, and look around under their pub/hamradio/mods directory. I u/l'd a file there recently which was placed (!) in the uniden/bearcat subdirectory, called bc100all.mod, which includes all the mods I know of for the 100XLT.

Oh, BTW- you can't get cellular on a unit not equipped for 800 MHz already (see mod file for details), and there's no mod I know of for programming in out-of-band (at least below 29MHz) freqs. CB channels are AM, anyway, and 29-54 coverage is FM on the 100XLT.

a.k.a. you're out of luck on this request.

time you
SB> use your cell-fone!

I have no idea how you can equate knowing what the law says, and being 'pro-cellular-ban'. I do NOT agree with the law, think its ill-conceived, and even more poorly implemented. It IS, however, the law. And I never said you CAN'T get a scanner through Customs. In fact, I said there wasn't much chance of it being caught there. And I use neither cellphone nor cordless (the Ca. against cordless phone monitoring is just as poorly conceived and implemented).

>your wisdom!

I have had one for about 2 months now. I haven't had much time to play with it yet, but so far I have been very impressed. Is has excellent RF performance. I would rate it above my Icom R7000. I have not really tried out the shortwave yet but a quick pass sounded pretty good. For the size, this unit can't be beat. The programming is a bit awkward (lots of button pushing), but you'll probably get used to it. I got a couple of programs to control it off of compuserve, but I am still looking for a good control program. One nice thing is that it has the DB25 (RS232) jack right on the back. No converter required (like the R7000). It only took me about 10 minutes to get computer control set up, so its pretty simple. The programmable attenuator (by channel) is the greatest. If a particulat channel is giving you trouble with noise or intermod, you just set the attenuator and *poof* smooth scanning.

I picked up an audiovox handheld cell phone at a local hamfest recently (cheaply). My intent was to play, hopefully figure out how to turn on the receiver portion (for educational purposes only, for those ECPA followers out there). I took it apart and can't get the thing to power up. There is no obvious switch visible anywhere and when I feed power into the board...nothing. Obviously inactivation of this phone is not as simple as I had hoped. Does anybody have any suggestions short of going to a cell service provider ?

Does anyone out there know the freqs for any of the weather
fax transmitters. I just go a cool shareware program for the
Mac from a guy in Finland called RadFax ($25 for full source)
that seems to work rather well. All you have to do is plug
your ham radio's speaker into the Mac's microphone input
(I was just holding my scaner to the Mac mic and it seemed
to work just fine for cellular faxes -- just a test mind you).

Thanks in advance,

On Saturday June 4'th we will take a look at Digital Audio broadcasting or DAB. This high-tech system is in the wings and should be here near the end of the century. A few systems have been proposed for dab and a standard hasn't been decided as of yet. Our guest will be Ted Schober. Ted has been on the leading edge in the world of DAB and will give us a look into the radio of the future.

On Saturday June 11'th we will take a look at VSATS, (very small apachure earth terminals). Vsats are the newest high-tech method of satellite communications. Our guest will be Bill Septmeyer. Bill is an engineer and founder of National Supervisory Network (NSN). Nsn is on the cutting edge of this new communications technology. So join us on the 11'th of June when we take to the sky on Spectrum.

On Saturday June 19'th Spectrum will celebrate its one year anniversary with a special show. You'll just have to tune in and find out what happens.

--
Spectrum airs live Sunday at 0200 UTC (2200 EDT Saturday) on:

WWCR, 5810 KHz, Nashville, TN (World Wide)
WIFI, 1460 AM, Florance, NJ (Philadelphia Area)
KHNC, 1360 AM, Johnstown, CO (Denver Area)
Omega Radio Network, Galaxy III, X17, 5.8 MHz WIDE audio. (Satellite)

Spectrum is rebroadcast:

Sunday at 1500 EDT, on WIFI, 1460 AM, Florance, NJ (Philadelphia Area)

4525. Frequency counters (update)

Newsgroup: rec.radio.scanner
Date: 1994-06-02 14:59:49 UTC
From: jerry@hnrc.tufts.edu
Message-ID: <1994Jun2.095949.2428@hnrc.tufts.edu>
Source record: 273576
Cross-posted to: rec.radio.scanner,rec.radio.amateur.equipment

I'm farther along in my search for a frequency counter, but not exactly where I'd like to be. All things being equal, I'd go with the Opto M1, even though at $260 with antenna and postage it's about twice what I'd like to get away with. But all things aren't equal. if a Startek ATH-10 would truly meet my needs, I could get off for about $170 while an ATH 15 would set me back $210. (15 = 10 + low battery indicator + 1200 to 1500 MHz + signal strength bar graph)

According to Grove, the person who started Startek was originally with Opto and, in the opinion of the person with whom I spoke, the units use comparable technology.

The only substantive responses came from two very satisfied Opto owners. I'm still waiting for hear from a Startek owner. The comments follow.

Are there any dealers who sell the OM1 below list? The only vendors I could locate are Grove and Opto themselves.

Anyway my opinion is that if you want to use the counter with a scanner that you should consider buying the M-1 from Opto. I own an Opto M-1 and an Opto 2810. The M-1 was purchased about a week ago at the Rochester Hamfest.

The M-1 essentially has two automatic hold features. One is a digital filter. When the filter is on,the counter will hold the last frequency it has counted above the noise floor (until a new transmission takes place). When the filter and the memory switch are both on the counter will hold a received frequency until the memory is toggled for a new reception. There are three registers for frequencies in the memory.

The only thing I don't like about the M-1 is that the three registers don't fill up automatically. The first one is filled and then the user must hit a button so that the first one moves to the second position and then another frequency can be recorded in memory. In practice I am using the filter to hold the frequency instead of the memory. This means I have to use the memory in my head adn keep an eye on the counter.

Another neat thing about this counter is that the light will come on whenever a frequency is received with the filter on. This makes it easier to keep an eye on the counter. That is, the light tells you when to look. (The light can be turned on or off - this is up to the user, too.)

Anyway, I hardly ever used my old counter. I have been using the new one this week quite a bit. The type of things that are easy to pick up are taxis and such. There is also a tendency for the counter to pick up pagers which I think use very high power transmitters.

The Sysop of the Compuserve Hamnet Scanner message area likes his Startek unit. The man that sold me the Opto talked me out of the Startek. The truth is I'm not sure which unit is the better one. There is a mod to add a hold to the Radio Shack unit.

The man selling the Opto at the Hamfest was from Ramsey in Rochester NY. The main feature that he pointed out to me was that the counter counts up to 250 MHz without using a multiplier. He implied that the Startek didn't go as far but I didn't get into really detailed comparison. The other differences had to do with the type of reset on the memory of the Startek, the cost of the Startek with the memory hold and reset (which I think was $249 or more at the Hamfest), the LCD vs. LED situation (Startek still uses LED's) and probably some other things. He really didn't sell me on what I think is the best feature - the digital filter - which acts to hold a frequency in the display until the next one breaks through the noise. I guess I'm sold on the M-1 now.

I updated to an Optoelectronics M-1 about a month ago and have since taken it on a trip to pick up hotel freqs.
The unit works great esp compared to my older more basic Optoelectronics 2210. It has autocapture, digital filter to reduce false "hits" and even an output for RS-232 interface (extra cost option). The unit is backlit and uses LCD screen so it is much easier to see in daylight.

I can highly recommend this unit. Don't know about the Startek units - in ways they seem similar - I can tell you that the store and hold is really helpful, especially if used while driving. The M-1 also has a 3 register memory for storing freqs captured.

the Starteks use LED display
- I found this a major minus in my older Optoelectronics scanner - it shortened the battery life to 2 hr between recharges as well as the problem of daylight visibility.

Well, I'll give you the quick and dirty mod and then after that you should try to get ahold of the scanner modifcation handbooks. I hear they are chock full 2006 mods. I have a 2006 as well and have not gotten the book yet. I know shame shame. Anyway, take the cover off and find the two diodes behind the number 3 on the back of the keypad. Clip one leg of each of the diodes and separate them slightly. You will have just performed the scan speedup and cell restoration mod. There are many others for that model. Have fun.

It's not illegal to listen to them in Canada. Remember that Usenet is worldwide and so far it's only illegal to monitor cellphones in the U.S.

4539. Help With 150MHz Images-Pro43?

Newsgroup: rec.radio.scanner
Date: 1994-06-02 21:12:25 UTC
From: veith@cherokee.nsuok.edu
Message-ID: <1994Jun2.211225.16429@cherokee.nsuok.edu>
Source record: 273667

As others have reported, so do I have problems with overloading and/or images in the 150-160 Mhz range. I had hoped for better performance from a triple conversion receiver.

My particular situation is thus: I'm using the '43 in a location about a mile and a half from "watertower hill" the central site where all repeaters in my rural community are located. Sheriff, Police, Fire, Amateur, etc. My problem is overloading or imaging from the Pager system (not sure of it's location). The Pagers are totally wrecking my reception.

Anyone tackled this problem successfully? I thought about switching to the lowest gain antenna I could find or build an outboard attenuator but...that would in turn wreck my dx and weak signal reception. I wonder...what about a brute force sharp filter for the paging freq?

Any ideas will be appreciated.

Charles (KG5TV) veith@cherokee.nsuok.edu Tahlequah, OK

4540. Pro-2027

Message-ID: <12a.2185.757.0N3E2044@compudata.com>
Source record: 273665

I just bought a Pro-2027 at Radio Shack for $220. They had the Pro-2026 on sale for $149 but because it's a mobile scanner I would have had to also buy their regulated 120VAC-to-12VDC power supply. But that would have jacked the price up to about $210. The guy at Ratfink Shack told me that the Pro-2026's could not be modified to receive the 869-895MHz band. Was he pulling my leg or what? Anyway, what I want to know is does anyone know where I could get something comparable to the Pro-2027, for a lower price? I'm trying to stay away from a mobile unit if I can. Also am I missing anything good by not being able to pick up 869-895MHz? I made sure that Ratsh*T Shack would take the scanner back if I found something better in the next 30 days. So come on folks I need some help. Help save me money!!!

.....

4541. Re: Anyone own the MAX 800 from Cellular Se

Newsgroup: rec.radio.scanner

In <CqC02o.A37@freenet.carleton.ca> an678@FreeNet.Carleton.CA (Robert C. Walker) writes:

>The price seems outrageous, and I know people who have built their own
>versions of the MAX 800. But, the unit is well built and really helps.

kevin.jessup@mixcom.com (Kevin Jessup) then adds:

> As I understand it, the MAX800 is a 1/4 wave groundplane designed
> for 800/900 MHz. It is NOT a wide-band antenna. I've built my own
> 1/4 wave 800/900 MHz ground plane from an SO239 (UHF female panel
> mount) connector and welding rod. Sucks in 800 and 900 MHz stuff
> like crazy. Total cost (with coax): about $10.00.

I'll add that I took a good look at the MAX antennas (including the
MAX800) at the MAX booth at a recent hamfest.

Kevin N9SQB is right, they are just 1/4 wave groundplanes.
Upon further inspection, it turns out that they are built out of
what appears to be a regular SO239 panel mount, just like in the
ARRL books! The SO239 is nicely shrouded with a PVC (white plastic)
plumbing end-cap with holes in in to pass the rod elements, which
is why you cannot see the SO239 in the ads. The bottom is not sealed
in any way, so just looking up inside the PVC end-cap relveals the
SO239.

Conclusion: the MAX groundplanes are just standard "out of the book"
groundplanes, albeit nicely built ones.
For example, the rod element ends have little rubber tips pushed on
to give them a nicer appearance.
If you want a nice groundplane antenna (and they have all the
popular bands available, not just 800Mhz) , do not wish to
pick up a soldering gun to make your own, and money is no problem,
then why not.

MAX also had a nice 2M Quad antenna on display, build out of nice
fiberglass rod spreaders, adjustable retaining clips and copper
wire. Again, nothing the average ham could not build herself,
it's just that MAX did a nice job, and charges for it.

My homebuilt groundplanes (which I built for 2m and 70cm, not 800mhz)
cost me less than $10, just like Kevin. Also, I at least derived
some satisfaction from building my own which performs identically
to a commercial (MAX) version...

Hope this info is useful.

The 46 is actually made by Uniden, not GRE, for Radio Shack. Hence, the
intermod. The WX key is the clue that it is a Uniden made unit.

A lot of times, the employees will chatter amongst themselves if it's not busy. Given that it appears that most fast-food employees are in high school, the conversations usually end up centering around related social aspects (who's going out with who behind who's back, who's the asshole of the day, etc.). Pretty boring stuff too.

4547. Cellular on the "blocked" PRO-51

Newsgroup: rec.radio.scanner
Date: 1994-06-02 23:04:51 UTC
From: schuster@panix.com
Message-ID: <2sloij$3f2@panix2.panix.com>
Source record: 273666

From:76174.637@CompuServe.COM (Howard Bornstein)

There is an interesting test mode in the PRO-51 that, combined with the direct search feature of the scanner, lets you pick up out-of-band frequencies. You will have full access to the 66-88 Mhz ranges as well as the cellular base range of 869-896 Mhz.

Actually, there are several test modes in the PRO-51 (most of these comments should be true for any Uniden-made Radio Shack scanner, such as the PRO-46). I'll describe them first and then how to take advantage of one of them to get the restricted frequencies.

There are three data test modes. These modes completely destroy any frequencies you had programmed into your scanner, so it's best to use these techniques before you program your scanner. If you have already programmed it, you'll have to decide if these new capabilities are worth reprogramming.

Test mode 0. Clear the scanner.

A well-known method of clearing the scanner to all zeros is to hold down the 2 key, the 9 key, and turn on the scanner. All frequencies will be lost.

TEST MODE 1. Fill channels 1-25 with test frequencies.

Press the 2 key, the 9 key, the L/Out key, and turn on the scanner.

This fills channels 1-25 with these frequencies:

1 30.050
2 40.840
3 49.900
4 138.150
5 162.400
6 173.225
7 406.875
8 453.250
9 511.9125
10 108.500
11 118.800
12 127.175
13 135.500
14 66.450*
15 76.825*
16 87.425*
17 157.800
18 482.3625
19 29.000

20 54.000
21 806.000
22 857.200
23 888.96*
24 911.500
25 954.9125

* indicates not within the PRO-51's normal coverage. More on how to use these in a minute.

TEST MODE 2. Fill channels 1-17 with test frequencies.

Press 2, 9, Manual

Fills channels 1-17 with these frequencies:

30.00, 40.00, 50.00, 140.00, 155.00, 170.00, 410.00, 460.00, 510.00, 54.00, 109.00, 118.00, 127.00, 135.00, 810.00, 860.00, 950.00.

There is also a display diagnostic mode.

Display Test Mode.

Press 2, 9, Band or 2, 9, Moni.

This put the display in test mode. Every annunciator and every digit element is turned on in a scan from the left side of the display to the right. To keep this test mode continuous, release the buttons before the first scan finishes. This mode does not affect stored memory. Press any key to exit this display mode.

Now, if you've decided to try test mode 1, you will find several out-of-band frequencies stored in your memory channels. Channels 14-16 hold frequencies in the blocked out 66-88 Mhz range, and channel 23 holds a frequency in the blocked out cellular base range. Once you have these frequencies stored in a memory channel, the PRO-51's direct search feature will let you search though these ranges. In the cellular band, the scanner searches in the correct 30 Khz steps.

You don't have to keep these frequencies in these channels. You can move them to any channel in the scanner. First move them to a monitor channel.

While on a channel with one of these frequencies, open squelch completely. Press direct search button, either up or down. The direct search button puts the scanner into search mode and the open squelch holds the frequency. Then press the Monitor button. The frequency is now in the monitor channel indicated in the display.

Now you can move it to any regular memory channel in the scanner.

Enter the channel number
Press PROG
Press Monitor
Press the number of the monitor channel if the proper channel is not displayed
Press E(nter)

The frequency is now permanently stored in the memory channel. You can do a direct search from this memory channel at any time.

The 66-88 Mhz range mainly covers TV audio. However, there is a strange phenomenon concerning TV audio and the PRO-51. Channels 4, 5, and 6 audio fall within the 66-88 Mhz range, yet the PRO-51 will not pick up the audio frequency while searching in this range. However, TV channel 2 audio is at 59.75 Mhz. When you add the intermediate frequency of 21.6 Mhz, you get an image of the TV channel 2 audio appearing at 81.35 Mhz. This does come in, although raspy, since the PRO-51 is receiving in narrow FM mode while TV audio requires wide band FM mode for proper reception.

I'd be interested in anyone can verify that any of these test modes work on the PRO-46 or any other Uniden-made Radio Shack scanner.

The test modes I've described as modes 0 and 1 (clearing all channels and plugging in test freqs in the first 20 channels) have been around since the BC200XLT (I think also the BC100XLT). They also appear in the BC2500XLT, although I couldn't find any other test modes in that scanner. The BC220XLT allows you to do a display element test mode, but, unlike Jeff, I haven't confirmed any other modes as I don't want to wipe out all my channels. I expect that Uniden-made Radio Shack scanners will have at least these two modes and may have the other modes as well. I'm hoping a PRO-46 owner will test this for us.

I wish I could take the credit for coming up with this trick, although it's ironic that I had all of the relevant info in my head...I just didn't put it together.

The basis for this trick came from Glenn Cohen of Scanners Unlimited who was told this by someone who walked into his store. Glenn confirmed it with Larry Van Horn at Monitoring Times. I independently discovered modes 3 and 4, which, to my knowledge, have never been published before.

I did find the display test mode works on the BC220XLT but didn't want to lose all my memories to try the others. Thanks for biting the bullet and seeing what happens on yours! Of course, without the RS direct search feature, the test freqs in the Uniden-label scanners don't do much good.

Hi, Kirk...
Membrane boards are a pain. It usually is two sheets of adhesive that
hold the metal parts together and short when there is slight pressure. If
the metal parts are damaged in some way, you get what you described.
Would probably be easier to replace the keypad or front panel.

>have jacked the price up to about $210. The guy at Ratfink Shack told me
>that the Pro-2026's could not be modified to receive the 869-895MHz....

Take back the 2027 and buy the 2026. You don't need the heavy-duty
expensive power supply; mine works fine with a 12VDC 500ma wall plug.
I use Radio Shack's 273-1652 at $10.95. Who cares that it's called a
"mobile"--it works fine indoors. And unless a new model is already out,
they lied to you about there being no way to do the mod.

I've toyed with the idea of buying a quick-release CB mount for my 2026,
so I could switch it back and forth from car to living room with no
effort. Just haven't gotten around to doing that yet.

My only complaint about using a mobile unit indoors is that the speaker
is on the bottom of the radio. Excellent for mobile use, but on the
table it loses volume. Solution--plug in an external speaker (this
radio has a handy minijack), listen to the radio upside down (the radio,
not you), or balance it on its side with the speaker facing you. I've
done all of these, and settled for turning the volume up higher with the
radio placed right-side-up on the table.

To save a little more--call MaryMac (the number is posted frequently),
and buy the 2026 (or even the 2027 if you insist) from them. They cut
Radio Shack's price substantially, and unless you live in Texas you save
the sales tax too.

Someone on Fidonet suggested using a duckie cut for UHF (e.g. 440). The
reduced gain on VHF-hi might help, and it should still have acceptable
gain for 800. Haven't tried it, but it sounds reasonable.

>is it?

Shouldn't be. The RF circuit of the 200 is that of a 100 with an 800 MHz
downconverter board.

4553. Bearcat 260 Mods

Newsgroup: rec.radio.scanner
Date: 1994-06-03 00:10:56 UTC
From: acs@news.sccsi.com
Message-ID: <1994Jun3.001056.5940@nuchat.sccsi.com>
Source record: 273560

Does anyone have a source for mods to extend the frequency range of the Bearcat 260 scanner? Other than getting very hot on the top when the display dimmer is too high, this is a good scanner. But I need to extend the range somewhat. The scanner books I see on the shelves don't mention anything about conversions. Is there another model very similar that I can use to change the freq. range?
Thankd,

Actually, the Secret Service protects foreign Heads of State, i.e. Queen Elizabeth, and Heads of Government, i.e. Prime Minister John Major.

The State Department's Diplomatic Security Service protects other high ranking Foreign Goverment Officials, i.e. Foreign Ministers, and other Distinguished Foreign Visitors and Official Guests of the United States, i.e. Mandela, before being elected, Gorbachev, after leaving office, various Princes and Princesses, and the first ladies (or men) of foreign countries when visiting the U.S. without their Head of State/Head of Government spouses. The Diplomatic Security Service also provides protection for visiting Heads of Government of unrecognized countries.

Scanning drivethrus is a fun way to introduce a passenger to the hobby of scanning. It is a direct and startling example of how extensive the hobby can be. After demonstrating this kind of reception to a friend, I explain how much of what goes through the air can be picked up.

On this group I have heard almost every category of scanning labeled as boring at one time or another. Taxi-cab listening was hit hard once. Cellular often is. I could add newspaper delivery now, but I won't, because for me, what is most interesting is not the specific content of the transmissions, but the fascinating fact that they can be intercepted with such ease.

Ever since I saw the Public Television series "Pioneers of the Air," I have sought the capability to receive as many radio signals as is possible. The attempt has initiated an inexhaustible hobby that could last several lifetimes.

When I collected postage stamps, I preferred cancelled stamps to mint ones, because they had a history. Frequencies are like that now. I don't linger long on the drivethru frequencies, but I smile when I log them, glad to have achieved that little bit more of access to the vast sea of active frequencies that surrounds me.

Recently, brian.oakley@chrysalis.org said this here:

> sorry bill but the actual law wording is very clear. the wording says the
> type of communications that are illegal to intercept, not the frequencies.
> ecpa covers a lot more than cellular phones. cellular phones are considered
> communications not intended for monitoring or reception by the general public
> and are therefore illegal to monitor via ecpa. doesnt matter if you use a
> scanner, or tv, or whatever. 73.

I'm glad someone has finally pointed this out. The ECPA makes it illegal to monitor just about anything that begins or ends with a wire-line communication. Besides cellular telephone, the ECPA makes it illegal to monitor pagers and a lot of stuff most people never even thought about, and the law couldn't care less about how you actually go about monitoring it. If I were to write down what was said in a cellular phone call on a piece of paper, hand you the paper, and you read it, that is a violation of the ECPA (not to mention I just violated the Communications Act of 1934 also). Just because I'm a curious kind of person, I checked the ECPA before I started writing on this reply. In the text of the law, the words "cellular telephone" only appear TWICE. The word "scanner" does not appear ANY. And that is in a text file that is over 2300 lines long!

Now, before anyone gets the wrong idea, please note that this applies to only the United States and its possessions, and please also note that I'm not preaching about whether or not you should monitor cellular phone...my 2004's all seem to have a few clipped diodes too ;-)

Anyway, based on what I have read in this group over the last few weeks, it appears to me that atleast 80% of the people here have never actually read the ECPA. So, with that in mind, if anyone reading this wants a copy of the Electronic Communications Privacy Act of 1986, complete with the index and the table of contents, and you can't locate it anywhere else, drop me some email and I'll be happy to email it to you. But be warned, this law is some of the hardest to read government mumbo-jumbo you are likely to ever see! All I ask is that when you send the email, please put "ecpa" in the subject line. I belong to about a dozen or so lists, and its not unusual for me to get a hundred messages a day. If you put "ecpa" in the subject line, that means I'll see it easily and act upon it as soon as I can, otherwise it may be a week or more before I notice your request. Also, please let me know if it is a problem for you to receive email messages that are 100k or so long.

Happy listening!

David

Around here they tend to use 151.625 which is an itinerant frequency. The
radios are available cheaply most anywhere and I suspect that most don't
bother with the formality of a license. I just listened to 5 baloons on the
way into work today. We see a lot of them as there is a major manufacturer
of them in town. We get to see the custom baloons first - such as the
promotional beer/pop cans, houses and arks. They even make most of the
parade baloons, such as mickey, snoopy, etc...

It would seem that it is illegal. The wording is:

CHAPTER 119. WIRE AND ELECTRONIC COMMUNICATIONS INTERCEPTION AND
INTERCEPTION OF ORAL COMMUNICATIONS

Sec. 2510. Definitions

As used in this chapter --

(1) "wire communication" means any aural transfer made in whole or in
part through the use of facilities for the transmission of communications
by the aid of wire, cable, or other like connection between the point of
origin and the point of reception (including the use of such connection in
a switching station) furnished or operated by any person engaged in
providing or operating such facilities for the transmission of interstate
or foreign communications or communications affecting interstate or
foreign commerce and such term includes any electronic storage of such
communication, but such term does not include the radio portion of a
cordless telephone communication that is transmitted between the cordless
telephone handset and the base unit;

(2) "oral communication" means any oral communication uttered by a
person exhibiting an expectation that such communication is not subject to
interception under circumstances justifying such expectation, but such
term does not include any electronic communication;

(3) "State" means any State of the United States, the District of
Columbia, the Commonwealth of Puerto Rico, and any territory or possession
of the United States;

(4) "intercept" means the aural or other acquisition of the contents of any wire, electronic, or oral communication through the use of any electronic, mechanical, or other device.

[note: no distinction as to whether "any device" is operating with poor image rejection]

[...]

Sec. 2511. Interception and disclosure of wire, oral, or electronic communications prohibited

(1) Except as otherwise specifically provided in this chapter any person who--

(a) intentionally intercepts, endeavors to intercept, or procures any other person to intercept or endeavor to intercept, any wire, oral, or electronic communication;

(b) intentionally uses, endeavors to use, or procures any other person to use or endeavor to use any electronic, mechanical, or other device to intercept any oral communication when--

[etc.]

>Recently, brian.oakley@chrysalis.org said this here:

>> sorry bill but the actual law wording is very clear. the wording says the
>> type of communications that are illegal to intercept, not the frequencies.
>> ecpa covers a lot more than cellular phones. cellular phones are considered
>> communications not intended for monitoring or reception by the general public
>> and are therefore illegal to monitor via ecpa. doesnt matter if you use a
>> scanner, or tv, or whatever. 73.

>I'm glad someone has finally pointed this out. The ECPA makes it illegal to
>monitor just about anything that begins or ends with a wire-line communication.
>Besides cellular telephone, the ECPA makes it illegal to monitor pagers and
>a lot of stuff most people never even thought about [...]

According to Title 18, Part I, Chapter 119, Section 2510, (12)(C),
tone-only pagers are exempted. I think that's where it is - I'll have
to look it up.

>But be warned, this law is some of the
>hardest to read government mumbo-jumbo you are likely to ever see!

Don't forget - it's also technically inaccurate and vague in many places.

4576. wanted computer controlled broadcast band radio

Newsgroup: rec.radio.scanner
Date: 1994-06-03 16:35:57 UTC
From: hunter@work.nlm.nih.gov
Message-ID: <HUNTER.94Jun3123557@work.nlm.nih.gov>
Source record: 273381

(sorry if this is a duplication.)

Folks,

I have an application which requires the remote monitoring of a variety of broadcast stations. I basically need a moderately high fidelity broadcast band radio (AM/FM, US station spacing) that can be computer controlled. That is, I need to be able to turn the radio on and off, and set the reception frequency by PC. I also need a line-level audio output. I will probably be buying between 50 and 100 of these, so price is somewhat of an issue.

I have a couple of questions:

1. Are there "tuner" cards that fit into a PC chasis? What is their performance like in the rf environment inside a computer? Does anyone have any specific experience with them?

2. I am aware of the Kenwood RZ-1, which seems like overkill for this application. Does anyone know of any other radios that both tune the broadcast bands and have a serial port control?

Any other advice or input is welcome. Thanks!

Larry

Is anyone else monitoring any of the USGS seismograph telemetry signals
in the 162-174 Mhz, 216-220 Mhz, or the 406-420 Mhz bands?

I use a homebrew demodulator to decode the telemetry (non-encrypted for the
ECPA fans) and feed the +/- 5vdc signal to an A/D card in a 286 computer.
The seismograms are displayed real-time and interesting events saved to a
data file.

I'm looking to find some other demodulator circuit designs...

|solve my problem. If I directly dial in a channel it does
|pick up the strong active signal, but if I scan over the
|freqs the scanner just goes right over it. Any reasons ??

|Let me add that it does pick up some channels sometimes,
|but it seems to be skipping active channels alot of the time.

|Any help would be appreciated.

I'm surprised this topic has not come up before! When I first
got my R1, I experienced the SAME thing! Look into the MANUAL
(oh no! not the MANUAL!!) for the section on using the setup
facility. There is a feature called "powersave" or somthing
like that which is on by default. This "feature" prevents
the unit from locking on a frequency for more than 10 seconds.

Is your radio stopping for exactly 10 seconds? if it is, then
this is probably your problem.

>: In actuality, ARRL stands for AMERICAN Radio Relay League. That name
>: would seem to give even less of an excuse for such a narrow focus.

>Yep. Radio Relay League....sounds like scanning to me!
^^^^^

Since when does "radio" mean ONLY "Amateur Radio" ??

Let's see what Mr. Webster has to say about this.......

webster radio
Webster's 7th Collegiate Dictionary, Copyright (C) 1963 by Merriam-Webster, Inc. No part of this information may be copied or reprinted without the express written consent of the publisher.

1. ra.dio \'ra-d-e--.o-\ n [short for radiotelegraphy] 1a: the wireless transmission and reception of electric impulses or signals by means of electric waves 1b: the use of these waves for the wireless transmission of electric impulses into which sound is converted 2: a radio message 3: a radio receiving set 4a: a radio transmitting station 4b: a radio broadcasting organization 4c: the radio broadcasting industry 4d: communication by radio
2. radio aj 1: of, relating to, or operated by radiant energy 2: of or relating to electric currents or phenomena of frequencies between about 15000 and (10)11 per second 3a: of, relating to, or used in radio or a radio set 3b: specializing in radio or associated with the radio industry 3c1: transmitted by radio 3c2: making or participating in radio broadcasts 3d: controlled or directed by radio
3. radio vt 1: to send or communicate by radio 2: to send a radio message to : to send or communicate something by radio

Looks pretty much like about everything radio to me, Jim. Maybe it's about time for ARRL to change its name to "Amateur Radio Relay League", if they insist on sticking their heads in the sand of one narrow part of it all.

As much as I respect Jim for his comments in other forums, I have YET to hear any substantive comments from him or the ARRL as to just why they think the precedent of the Electronic Communications Piracy Act will never affect Amateur Radio. That's the PRECEDENT of it, as in influences on later decisions.

It is all too easy for them to say that the ECPA itself does not, which is probably true. It seems like the ARRL is unwilling to fight for the future, preferring to be mired in the past and unable to deal with the present.

Assume what you want, but the legal meaning of "malice" is:

"The intent, without just cause or reason, to commit an unlawful act
that will result in injury to another or others."

You would have to show "just cause or reason" that you were listening
to the conversation, which is "an unlawful act."

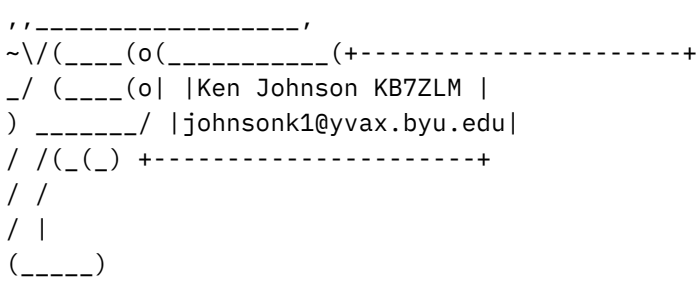
I agree that it would be boring, but at some places around here I'd like
to be tuned in while I go through the drive-thru so I can roll up my
window and not get my ear blasted with 150 decibles. Then maybe I could
understand what they're saying since I'd have a decent receiver with a
decent speaker, instead of the bad setup some of these places have.



4587. RS Frequency Counter

Newsgroup: rec.radio.scanner
Date: 1994-06-03 20:41:43 UTC
From: johnsonk1@yvax.byu.edu
Message-ID: <1994Jun3.134143.7975@yvax.byu.edu>
Source record: 273617

The other day I was in Radio Shack and noticed their frequency counter. Since I'm interested in getting one, I asked the guy if I could try it out. I got one of their CB's, and the thing tuned in only within about 25 ft. I had to put the thing within 6 inches of the room monitor and the wireless intercom in order for it to get their frequencies. Maybe I was doing something wrong, but that seems like very poor performance. We checked the batteries, and they were fine. The RS guy didn't know what the thing was, let alone how to operate it, and I didn't know too much either, so maybe we weren't using it right. Still, I'm saving my money for something better.

> promotional beer/pop cans, houses and arks. They even make most of the
> parade baloons, such as mickey, snoopy, etc...
>

I re-freqed a radio for a balloon guy onto 151.625 last fall. From what he said that frequency is in common use for this type of activity. I warned him that the frequency was really busy. I guess it was an improvement over the fire department channel that was in the radio when he bought it! He told me he almost got into trouble with the Canadian DOC when he interferred with a local fire department.

4596. Bought a 2006, need MODS & TRICKS!

Newsgroup: rec.radio.scanner
Date: 1994-06-04 00:36:54 UTC
From: Bud_Jamison@f1010.n202.z1.fidonet.org
Message-ID: <9406042341.AA144542@f217.n202.z1.fidonet.org>
Source record: 273485

EN> group. Now, I need to know if anybody has MODS or tricks for
this unit.
EN> I think it is one of the newer models, but the Radio Shack clerk
told me
EN> that the one I got *is* easily modifiable.

Start by taking the top case off. Look behind the #3 key, and you
should see 2 diodes sticking up. Cut the top loop on both. One opens
up the cellular band, the other increases scanning speed by about 20%.
If you want more mods, let me know, I have others, but they're more
complicated.

--- ProBoard v2.01 [Reg]
* Origin: Can YOU handle 28,800 speeds? Call Zoom! (1:202/1010)

4597. Re: anyone actually 740 a scanner in?

-=> Quoting Clifton T. Sharp to All <=-

CTS> From: clifto@indep1.chi.il.us (Clifton T. Sharp)
CTS>
CTS> With all this talk about how it should be legal etc. to get a
CTS> scanner such as a Yupiteru sent in from out of the country, has anyone
CTS> actually done it and received the scanner?
CTS>

There are several happy users of the Yupi on CompuServe. 'Course, they
got theirs before the law went into effect. Haven't heard of any who tried
to get one after the law.

Jerry

-=> Quoting Eric Norber to All <=-

EN> From: eric@garnet.msen.com (Eric Norber)
EN>
EN> Okay folks, I bought a Pro-2006 based on a lot of recommendation from
EN> this group. Now, I need to know if anybody has MODS or tricks for this
EN> unit. I think it is one of the newer models, but the Radio Shack clerk
EN> told me that the one I got *is* easily modifiable. If anybody has any
EN> performace improvements, I'd be delighted to see them. Of course, they
EN> would only be used for *hypothetical* modification <g>. Looking
EN> forward to responses! - - Eric (P.S.- e-mail responses also
EN> appreciated!)

Heck, what do you want it to do?

Clipping two diodes behind the key panel will enable continuous 800 mhz
coverage and increase scan speed from 26 cps to 30.

Bill Cheek has several Scanner Mod books out. They include all kinds of
things for the 2006. They include increasing memory channels and speed up.
He also has an interface for computerized programming and scanning.

-=> Quoting George Lyle (233789) to All <=-

GL(> From: glyle@marie.seas.ucla.edu (George Lyle (233789))
GL(>
GL(> I'm curious. Why would anyone want to listen to drive-through
GL(> order discussions? I think it would get pretty boring after
GL(> oh... say... 30 seconds or so.
GL(>
GL(> Of course, this could be the start of the "Have you ever
GL(> helped your McDonalds with your scanner?" thread! :-)
GL(>
GL(> Enlightenment, please?
GL(>
GL(> George

George...you ought to give a listen. It's not listening to the ordering of food that's fun...it's the carrying on that goes behind the scenes. The radios also run in simplex with other workers. I remember one story at a Burger King...This guy was ordering his food at the drive up window and finished it with 'to go'. She gives the total, then says on simplex, 'Of course it's to go...it's a f*****g drive thru! '.
